                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of creating a target single-stranded region in double-stranded DNA that comprises: (a) nicking at least one site bordering the target region in double-stranded DNA with at least one site-specific nicking endonuclease; and (b) subjecting the nicked DNA to conditions where the target region is selectively denatured. The method is useful for creating expression vectors, attaching detection probes or purifying DNA molecules containing the single-stranded region. The present sequence represents a generated DNA region of 18 or 12 nucleotides in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Autosomal dominant early-onset Alzheimer's Disease; AD4; STM2; neurodegeneration; senile dementia; human chromosome 1; Volga German kindred; VG; yeast artificial chromosome library; expressed sequence tag database; polymerase chain reaction; PCR primer;

This PCR primer is used for allele specific amplification (ASA) of the allelic variant of the serotonin 5HT7 receptor (5HT7leu). This is used for screening large numbers of samples for 5HT7leu variant. The invention provides a method for detecting DNA that codes for a 5HT7leu allelic variant which comprises amplifying human DNA with primers capable of amplifying a sequence encoding the third intracellular loop of the human 5HT7 gene and determining if the amplified DNA comprises a sequence in which a C-to-T alteration converts a Pro codon to a Leu codon. The 5HT7leu variant and associated DNA and assays provide important investigative tools for both behavioural research and the screening of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel human protein; NOVla; NOVlb; NOVlc; NOVld; NOVle; NOV2a; NOV2b; NOV3a; NOV4a; NOV5a; NOV6a; NOV6b; NOV6b; NOV7b; NOV1b; NOV1lb; NOV1lb; NOV1lc; NOV1ld; NOV1ld; NOV1ld; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la; NOV1la;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A genetically isolated group of families with autosomal dominant early-
onset Alzheimer's Disease (AD) has been studied and initial mapping
analyses have predicted the AD4 locus (also known as STM2) resides on
chromosome 1. The present sequence corresponds to a PCR primer which was
used during the cloning procedure to isolate and sequence the AD4 gene.
The group of families has been dessignated the Volga German (VG) kindreds.
The entire gene has been amplified from VG individuals and unaffected
individuals (from VG and unrelated lineages). Sequence analysis has shown
that affected individuals have a nucleotide change at codon 141 resulting
in an amino acid alteration from Asn to 11e. Portions of a mutant AD4,
especially one in which Asn at position 141 has been replaced by 11e, can
be used in a peptide vaccine. Detection of mutant AD4, for example using
antibodies specific for the protein or using nucleic acid probes specific
for the mutant gene, provides a means of diagnosing Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New Alzheimer's disease related gene, AD4 - used to develop prods. for detecting pre-disposition to or for diagnosis, prevention or treatment of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Allelic variant; serotonin 5HT7 receptor; alcoholic offender; 5HT7leu; neuropsychiatric drug; screening; allele specific amplification; ASA; PCR primer; ss.

kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA, and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD denes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of the SCD (stearoy)-COA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siNA; (2)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        short interfering nucleic acid; siNA; downregulation; inhibition; SC stearoyl-CoA desaturase; RNA interference; anorectic; antidiabetic; antiarteriosclerotic; cytostatic; virucide; obesity; diabetes; atherosclerosis; cancer; viral infection; drug screening; genetic engineering; pharmacogenomic; gene mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          diagnosis of obesity or diabetes, downregulates expression of the stearoyl-CoA desaturase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to biochemical processes that are carried out directly on a substrate using novel assemblies which hold the substrate, and also one or more reaction chambers located over target location(s) on the substrate. The assemblies, devices and reaction containment member are useful to perform chemical reactions on substrates having target procation(s) containing a biological sample, especially to analyse for the presence of a biomolecule in a sample, or to analyse a biomolecule in a sample, or to analyse a biomolecule to obtain information concerning its identity or structural/functional properties. They are useful e.g. in medical diagnosis and screening (e.g. to diagnose a genetic disorder by detecting a particular nucleic acid polymorphism, or to diagnose infection by detecting characteristic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Assemblies for conducting chemical reactions on substrates useful e.g. in disease diagnosis or drug discovery, in which one or more reaction chambers are held over target locations on substrate enabling retention
kits for in vitro or in vivo delivery of siNA, (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiatreriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Biochemical; substrate; medical diagnosis; screening; genetic disorder; polymorphism; infection; drug screening; binding; therapeutic agents; PCR; primer; ss.

elements of a pathogen) or in drug screening (e.g. by detecting binding of a molecule to a receptor and/or functional consequences of such binding to identify therapeutic agents). They are especially useful to conduct multiple different reactions which can be analysed separately and for reactions involving thermocycling, by integration of a thermocycling function within the substrate. They can especially be used to perform a reaction on a target biomolecule such as amplification of a portion of a nucleic acid molecule (e.g. by PCR), or to determine the identity of a nucleic acid molecule assemblies require low volumes of chambers on a substrate surface, assemblies require low volumes of reagents and enable reaction product to be retained for detection/analysis in a defined location, so reducing transfer of reagents and processing time required for performing analysis. When the substrate is adapted for thermocycling, assemblies enable faster heating and cooling of reaction mixtures than with conventional thermal blocks. The current sequence represents a PCR primer used to perform 4-plex PCR. On genomic DNA in an assay to identify polymorphic sites within human related to perform a start of the current sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences were determined from the ends of chromosome 11-specific cosmids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      by automated sequencing without intermediate subcloning. A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "Primer program available from E.Lander, MIT). The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequencing complex genomes, present as fragments in a cosmid library - L sequencing end-specific nuclectides of each clone then correlating with spatial relationship of cosmid, esp. for mammalian chromosomes.

sequence (TCS) and a stem duplex consisting of a 5, arm sequence of 3-25 nucleotides adjacent to and covalently linked to the 5 terminus of TCS and a 3-25 nucleotides adjacent to and covalently linked to the 3-25 nucleotides adjacent to and covalently linked to the 3-25 nucleotides adjacent to and covalently linked to the 3-25 nucleotides adjacent to and covalently linked to the 3-25 nucleotides adjacent to and covalently linked to the 3-25 nucleotides adjacent to and covalently linked to the 3-25 nucleotides adjacent to and covalently linked to the 3-25 nucleotides adjacent to an ember of the pair is conjugated to the probe in the vicinity of the 3-2 arm sequence and the members of the pair are near each other. Under the preselected assay conditions in the absence of target sequence, the probe has a characteristic signal whose level is a function of the degree of interaction of the first and second labels, the signal having a first level at 10 deg.C below the Tm, a second level at 10 deg.C above the Tm assay conditions at the detection temperature under the presence of an excess of target, hybridisation of the TCS to the target sequence alters
this method, 370 STSs specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping". The sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones. See AAQ82001-Q82706 for STS primers. (Updated on 25-WAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Labelled probes for nucleic acid detection - have self-complementary stem duplex region which is lost upon hybridisation to target sequence.

Mutations of the HNF-4 alpha gene have been identified by amplifying (see AAV5265-86) and sequencing the appropriate exon. The invention concerns the identification of genes responsible for non-insulin dependent diabetes mellitus (NIDDM) for use in diagnostics and theraspettics. It demonstrates that the MODY1 (maturity-onset diabetes of the young) locus is the HNF-4 alpha gene. Analysis of mutations in the HNF-4 alpha gene can be diagnostic for diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated nucleic acid encoding hepatocyte nuclear factor 1-alpha and 1-beta - useful for detecting susceptibility for non-insulin dependent diabetes, especially maturity-onset diabetes of the young.
the level of the characteristic signal from the third level toward the second level by an amount of at least 10% of the difference between the first and second levels and where a duplex of the target and its TCS is larger than the stem duplex. A specific example of such a probe was designed to hybridise to a HIV-1 integrase gene target. The target sequence was amplified using PCR primers having the sequences given in AAT45324 and AAT45325
                                                                                                                                                                                                            Gaps

Such oligonucleotides can be used in therapeutics for the treatment of a disease modulated by Stat-6, particularly for inhibiting the induction and maintenance of allergic-asthmatic reaction, e.g. for treating asthma

                                                PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs accode polygeptides (see AAX36754-273799) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0;
                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence represents a splice site within a DNA molecule encoding human PD-ATP-binding cassette (PD-ABC) protein. PD-ABC maps to chromosome 19p13.3 and is expressed in various tissues including spleen, thymus, peripheral blood leukocytes, bone marrow and lymph nodes. The PD-ABC DNA molecules and proteins are used to diagnose and treat cardiovascular disorders, infilammatory disorders, dyslipidaemia, epilepsy, diseases related to abnormal calcium flux, coronary artery disease, Tangier's disease, familial high-density lipoprotein deficiency, atherosclerosis, diabetes, fatty liver disease, inculn resistance, obesity, alcoholism, retinal degeneration, hypertension and vascular disease. The sequences are also used in drug screening assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PD-ATP-binding cassette, PD-ABC, chromosome 19p13.3; spleen, thymus; ds; peripheral blood leukocyte; bone marrow; lymph node; dyslipidaemia; cardiovascular disorder; inflammatory disorder; abnormal calcium flux; epilepsy; coronary artery disease; Tangier's disease; atherosclerosis; familial high-density lipoprotein deficiency; fatty liver disease; atherosclerosis; diabetes; insulin resistance; obesity; drug screening;

The sequence represents a splice site within a DNA molecule encoding human PD-ATP-binding cassette (PD-ABC) protein. PD-ABC maps to chromosome 19913.3 and is expressed in various tissues including spleen, thymus, peripheral blood leukocytes, bone marrow and lymph nodes. The PD-ABC DNA molecules and proteins are used to diagnose and treat cardiovascular disorders, inflammatory disorders, dyslipidaemia, epilepsy, diseases related to abnormal calcium flux, coronary arrery disease, Tampier's disease, familial high-density lipoprotein deficiency, atherosclerosis, diabetes, fatty liver disease, insulin resistance, obesity, alcoholism, retinal degeneration, hypertension and vascular disease. The sequences

The present invention relates to promoting hair growth in a subject which involves inducing or mimicking the effect of Wnt-promoted signal cransduction in a subject and inhibiting hair growth in a subject involves inhibiting level of Wnt protein or inhibiting an effect of Wnt-promoted signal transduction in a subject. The invention is used for prowiding and maintaining dermal papilla (DP) cell graft which involves culturing a DP cell from a subject under conditions that induce or mimic the effect of Wnt-promoted signal transduction, thereby providing and maintaining a DP cell graft. Preferably, the DP cell is cultured in the presence of Wnt, its fragment or analogue; lithium chloride, beta-catenin and/or LER!, an agent which inhibits beta-catenin phosphorylation or and/or LER!, an agent which inhibits beta-catenin phosphorylation or canging promote in subject's scalp, or face e.g., beard and/or mustache, or in conditions where subject suffers from genetic pattern cateriors, suffers from a hormonal disorder which decreases hair growth, or aduation or has received a treatment, e.g., radiation or hemotherapy, or a drug which is in need of hair growth. Hair growth is inhibited on the growth is useful for maintaining or promoting hair inductive activity.

Inhibiting hair growth is useful for maintaining or promoting anagen phase gene expression in the subject's scalp, face e.g., upper lip and/or chin. The present sequence is Wnt4 KP-PCR primer used in the method for modulating hair growth
                                                                                                                        Promoting or inhibiting hair growth in a subject by inducing or mimicking, or inhibiting effect of Wnt-promoted signal transduction,

The invention relates to antisense oligonucleotides targeted to a nucleic acid molecule encoding human Survivin, where the antisense oligonucleotide inhibits the expression of human Survivin. These antisense oligonucleotides are used in the treatment of an animal suffering from a disease or condition associated with Survivin, e.g. a therapeutically or prophylactically effective amount of the antisense oligonucleotides can also be used to treat a human suffering from a disease or condition characterised by a reduction in apoptosis comprising administering the antisense oligonucleotide day a reduction in apoptosis comprising administering the antisense oligonucleotide compared by a reduction in apoptosis comprising administering the antisense oligonucleotide to a human. In addition, the antisense oligonucleotide made a cytochocyci chemotherapeutic agent e.g. taxol or cisplatin, can be used to modulate apoptosis, cytokinesis or the cell with the antisense oligonucleotide no modulate apoptosis. Collaborating the cell with the antisense oligonucleotide and a cancer cell by contacting the cell with the antisense oligonucleotides AAS21768 represent Survivin used in the method of the invention
                                                                                                                                                                                                                        Novel antisense compounds for modulating the expression of Survivin and

New VMGLOM genes and polypeptides, useful in gene therapy or for preventing, treating or alleviating disorders with vascular component, e.g. varicosities, cardiopathies, cerebral disorders or cancer.

```
.
0
                                  The present invention relates to the isolation of novel human and mouse Wolfold Polypeptides (long form and short form), and the nucleic acid molecules encoding them. VMGLOMs (also referred to as glowulins) are a subtype of venous malformations (Was) called glomangiomas. In humans, WMGLOM has been mapped to chromosome lp21-22. WMGLOMs and the nucleic acids encoding for them are useful as a medicament or for incorporation into a diagnostic kit. Such medicaments are useful for preventing, treating or alleviating disorders with a vascular component, particularly where alteration of vascular smooth muscle cell phenotype is needed, e.g. varicosities, cardiopathies or cardiomyopathies, cerebral disorders and senere. The nucleic acids are also useful in gene therapy. The present sequence for PCR primer mVMGLOM-1 is used with PCR primer mVMGLOM-5 (AASI3501) to clone the mouse VMGLOM on in the methods of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to the isolation of novel human and mouse VMGLOM polypeptides (long form and short form), and the nucleic acid molecules encoding them. VMGLOMS (also referred to as glomulins) are a subtype of venous malformations (VMS) called glomangiomas. In humans, VMGLOM has been mapped to chromosome 1p21-22. The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (b) a clones of the genomic libraries contained in multiwell plates; (b) a primer designed based on the chromosome marker is equence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the created from the amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are
                                                                                                                                                                                                         ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
varicosities, cardiopathies or cardiomyopathies, cerebral disorders and cancer. The nucleic acids are also useful in gene therapy. The present sequence for forward PCR primer is used with the reverse PCR primer (AAS13516) to amplify total mouse cDNA in the methods of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 198-535 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention

The present invention relates to antisense compounds, compositions and methods for modulating the expression of Histone deacetylase I (HDAI).
Sequences of the invention are useful for inhibiting the expression of HDAI in cells or tissues and for treating an animal having a disease or condition associated with HDAI e.g., hyperproliferative condition, which is scancer of haematopoletic, lymphoid, myeloid or breast or a condition resulting from a viral infection. Antisense compounds either alone or in cesulting from a viral infection. Antisense compounds either alone or in combination with other antisense compounds or therapeutics can be used as combination patterns of a portion or the entire complement of genes expressed within cells and tissues. They are commonly used as research reagents and diagnostics. They may also be useful prophlactically such as to prevent or delay infection, inflammation or tumour formation. The present DNA sequence is an antisense oligonucleotide targetted to human
                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to averaging gene expression in cDNA library method involves (a) conversion of a double-stranded (ds) cDNA library preparade from an organism-originated mRNA into cyclic single-stranded (ss) DNA library, (b) preparing a biocinylated ds DNA or complementary biotinylated RNA from a ds library DNA; (c) hybridisation of the cyclic ss DNA library with the biotinylated ds DNA or RNA; (d) recovering unhybridised cyclic ss DNA from the biotinylated ds DNA or RNA; (d) recovering their hybridised cyclic ss DNA; ss DNA; and any of their hybridised cyclic ss DNA; and (e) transforming a host call with a ds DNA after forming ds from the thus obtained cyclic ss DNA. The method is for the construction of averaged DNA libraries for application in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          of

The invention relates to a nucleic acid library comprising genes or their fragments which are capable of modulating an immune response observed with airway hyperresponsiveness and/or bronchoalveolar manifestations of asthma. Also included are a method for modulating an immune response of an individual comprising modulating a gene comprising a nucleic acid at least functionally equivalent to a nucleic acid identifiable by a signature sequence (SS) given in the specification such as R1-SO-R1-A11, StO1-A12, and R1-SO-R1-B7, a substance (for use as a medicament) capable of modulating a gene comprising a nucleic acid at least functionally equivalent to a nucleic acid identifiable by SS and the use of a proteinaceous substance derived from a nucleic acid at least functionally equivalent to a nucleic acid identifiable by SS and the use of a proteinaceous substance derived from a nucleic acid at least functionally equivalent (for use as a medicament) against the production of an antagonist (for use as a medicament) against the substance. The antagonist and substance are useful for the treatment of an immune response observed with airway hyperresponsiveness and/or bronchoalveolar manifestations of asthma. The method is useful for
producing DNA arrays for specific tissues, organs or organisms in disease diagnosis, pathogen identification and evaluating drugs and therapies. With the DNA arrays, the detection is sensitive and reliable to give fast feedback of test results. Sequences ABL60899-596 represent nucleotide sequences derived from various rat genes, used in the course of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid library comprising genes which are capable of initiation, progression and suppression of an immune response, especially an immune response observed with airway hyper-responsiveness of asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR; primer; ss; nucleic acid library; immune response; asthma; airway hyperresponsiveness; bronchoalveolar manifestation; signature sequence; SS; chronic obstructive pulmonary disease; COPD; allergic disease; rhinitis; atopic dermatitis; urticaria; autoimmune disease; multiple sclerosis; inflammatory bowel disease; allograft rejection; infectious disease.
                                                                                                                                                                                                                                           Gaps

The Support is useful for the production of DNA chips, protein chips, sugar chips and biosensors for investigative and diagnostic uses. Ligands which can be immobilized to the support include agonists, antagonists, toxins, venoms, virus epitopes, hormones, lectins, hormone receptors, peptides, nucleic acids, drugs, sugars, oligonucleotides, proteins, antigens, monoclonal antibodies, cells, viruses, and avidins. In an example of the invention, the ligand bound to the support is a PCR primer targeted to a number of genes and used to diagnose the presence and potentially the transcription of the genes. This sequence represents a 3' primer targeted to the wingless-type MMTV integration site family member 5a gene
                                                                                                                                                                                                                               ò
       product capable of modulating the immune response. The substance is useful for treating an immune response, particularly asthma, chronic obstructive pulmonary disease (COPD), allergic diseases (frhintis, atopic dermattis, urticaria), autoimmune diseases (e.g. multiple sclerosis), inflammatory bowel disease, allograft rejection and infectious disease. The present sequence is a PCR primer used to amplify and/or characterise a mouse signature sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polyanion-coated ligand immobilization support for production of DNA chips, protein chips and biosensors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3' primer to amplify wingless-type gene for ligand support method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Primer; ss; support; ligand immobilization; activated polyanion; DNA chip; protein chip; sugar chip; biosensor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

Davidson HC;

The invention relates to a discovery that modulating an immune response in a mammal involves administering an inhibitor of the interaction of serotonin with a serotonin receptor. The invention is useful for modulating (e.g. inhibiting) an immune response (such as CD-4 or CD-8 dependent immune response); for inhibiting an immune reaction or response mediated by activation of serotonin receptor on an immune cell (such as T cell and B cell) due to the activation of the serotonin receptor on the cell and B cell) due to the activation of the serotonin receptor on the cell; for modulating an immune response of an autonimune disease (such as myasthenia gravis, idiopathic inflammatory myopathy, chronic neutropenia, rheumatoid arthitis, idiopathic thrombocytopenia purpura, autoimmune haematoid arthitis, idiopathic thrombocytopenia purpura, autoimmune changes, antiphospholiphia antibody syndromes, inflammatory bowel disease, Crohn's disease, unlecrative colitis, myocarditis, Guillain Barre syndrome, 'Duphocytic hypophysitis, Grave's disease, Addison's disease, hypoparathyroidism, type I diabetes systemic lupus erythematus, pemphigus vulgaris, bullous pemphigud, psoriasis, psoriatic arthritis, condometriosis, autoimmune orchitis, autoimmune erectile dysfunction, sarcoldosis, Wegener's granulomatosis, autoimmune deafness, Sjogren's condometriosis, wegener's farial charactical cystitis, development of the condometriosis, interaticial cystitis, doodpasteur's condometriosis, autoimmune orchitis, interatical cystitis, doodpasteur's condometriosis, autoimmune orchitis, interatical cystitis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometriosis, doodpasteur's condometrio syndrome, and fibromyalgia); for inhibiting a secondary immune response, in a mammal (preferably a human); and for inducing apoptosis or death in a cell or affecting a cell cycle process in a cell expressing a serotonin receptor by inhibiting transmission of a serotonin signal via a serotonin polymucleotide sequence raiso useful for treating fulminant AIDS. This polymucleotide sequence represents a 5-HT (5-hydroxytryptamine) receptor amplifying PCR primer relating to the invention Modulating immune response in mammal in treatment of e.g. multiple scalerosis, myasthenia gravis, chronic neutropenia, Crohn's disease, endometriosis, involves administering inhibitor of interaction of serotenin with serotenin receptor. New antisense compounds, useful for modulating the expression of BCL2-associated X (BAX) protein or for treating a disease or condition associated with BAX protein, e.g. Parkinson's disease, Hodgkin's disease or Alzheimer's disease.

Claim 3; Page 93; 139pp; English.

The present invention describes a compound (I) 8-50 nucleobases in length trargeted to a nucleic acid molecule encoding BCL2-associated X (BAX) protein, where the compound specifically hybridises with the nucleic acid molecule encoding BAX protein and inhibits the expression of BAX protein.

```
The compound specifically hybridises with at least 8-nucleobase portion of an active site on a nucleic acid molecule encoding BAX protein. Also described: (1) a composition comprising (1) and a pharmaceutical carrier or diluent; (2) inhibiting the expression of BAX protein in cells or tissues comprising contacting the cells or tissues with (1); and (3) treating an animal having a disease or condition associated with BAX protein comprising administering to the animal (1) so that expression of BAX protein is inhibited. (1) has nootropic, neuroprotective, and this and to an be used in antisense therapy, and as a BAX artagonist. The antisense compounds (1) are useful for modulating the expression of BAX protein, and for treating a disease or condition expression of BAX protein, e.g. familial amylotrophic lateral session of BAX protein, e.g. familial amylotrophic lateral secondated or a condition that arises from aberrant apoptosis. The compounds are useful as research reagents and in diagnostics. The present sequence represents a mose BAX chimeric phosphorothicate oligonuclectide, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 20 BP; 4 A; 6 C; 3 G; 7 T; 0 U; 0 Other;

Novel BS136 polypeptide useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating breast diseases such as breast cancer.

Example 2; Page 47; Opp; English

.; 0 The present invention relates to a novel BS136 polypeptide useful for detecting, diagnosing, preventing and treating breast diseases such as breast cancer. The invention is useful for preventing action of the tissue-specific BS136 polypeptide and for the therapeutic treatment of tumours and metastases. The present sequence is a primer used to sequence Screening, diagnostic and therapeutic methods in individuals with predisposition towards having a cancer, such as colon cancer, using base excision repair pathway or hMYH genes. primer; ss; PCR; human; screening method; hWYH; base excision repair; BER; APC; familial adenomatous polyposis; PAP; multiple colorectal adenoma; carcinoma; bowel cancer. This invention relates to a novel screening method for identifying an individual having a predisposition towards a cancer. Specifically, it refers to obtaining a test sample, preferably comprising the hMYH gene that occurs in the base excision repair (BER) pathway, and comparing this mucleic acid molecule to the corresponding region of the wild type sequence. This BER pathway gene, hMYH, acts to protect against G:C to T:A transverse mutations in a cancer marker gene such as APC that is seen in hMYH are associated with the onset multiple colorectal adenomas and carcinoma. The present invention describes a screening method for individuals that works to identify differences comprising any one of predisposition, particularly for bowel cancer. This signifies a cancer predisposition, particularly for bowel cancer. This oligomucleotide exemplification of the invention

The heavy chain variable region of murine MAD 84.66 was cloned as follows: Hybridoma DNA was extracted, completely restricted with ECORI and run on a gel. Fragments were extracted and ligated in the ECORI site of Lambda-ZAP. Phage were packaged and plated. Plaque screening was with a 991bp XbaI fragment from the mouse enhancer region, a 1.5kb cDNA fragment from the heavy chain constant region gene of hybridoma CEA.66-E3 and a 5.4kb ECORI fragment containing an aberrantly rearranged heavy chain fragment conteaining an aberrantly rearranged heavy chain fragion. Infomucleotides and a probe specific to the N-terminal region. This probe was used to allow upstream characterisation of the promoter region. See also AAQ10834-Q10846, AAQ10848 and AAQ11098
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Dicistronic expression vector; fusion PCR; antibody; cDNA library; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide probe (Bg-1B) below, specific for Bacteroides gingivalis, was derived by primer UP4B/1B. It is a species- specific probe that hybridises to the rRNA of B. gingivalis. It is highly sensitive and highly specific for detecting oral pathogons. AAN90419-87 can also distinguish between bacterial species, types and subtypes. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 24-OCT-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oligo-nucleotide probes for detection of periodontal pathogens - comprising a segment of nucleic acid capable of hybridising to bacterial ribosomal RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                               This inside PCR primer is used in fusion PCR, working in combination with an outside PCR primer to amplify a target mucleic acid sequence, in this case the kappa light chain variable region. The fusion PCR reaction is used to produce two fragments with cohesive termini, which when mixed hybridise to form an overlapping DNA duplex that is internally primed. Subsequent PCR extends the non-overlapping region to form a hybrid DNA mol. that is dicistronic contg. a first polypeptide coding sequence and a second polypeptide coding sequence linked by a dicstronic bridge. This method thus allows fusion of heavy and light chains prior to vector ligation, avoiding the cumbersome separate cloning of fragments. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  primers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chromosomal rearrangement; kin17 protein; SOS DNA repair system; RecA; genotoxic agent; zinc finger; DNA binding protein; PCR primer; hybridisation probe; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes nucleic acid molecules which modulate the srpthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the final-like tyrosine kinase 1 (fit-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67255 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
structure), has apparent mol. wt. 43 kD and is recognised by both anti-kin17 antibodies and antibodies against the RecA protein of E.coli. The Kin17 protein is involved in DNA repair; it can be used to monitor chromosomal rearrangements following exposure to genotoxic agents. Specific oligonucleotides (AAQ79937-Q79947) derived from the kin17 genomic DNA sequence, are claimed and can be used as hybridisation probes or as amplification primers. Oligos E and F are pref. used together in a primer pair. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like; tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                             Gaps

AAT99157-T99188 represent amplification primers used in the invention. These sequences were used to amplify developmental sequences, to determine the expression of the protein of the invention in various stages of embryo development. The protein of the invention is the anti-dorsalising morphogenetic protein (ADMP-1) of Xenopus. ADMP-1 is closely related to the human bone morphogenic protein 3 (BMP-3). The ADMP-1 can be used to treat and diagnose conditions involving inappropriate tissue proliferation, e.g. neuroblastoma, neuroma and neurofibromatosis. The polynucleotide can be used to probe mammalian DNA libraries for mammalian equivalents of ADMP-1
                                                                                                                                                                                                                                                                                                                                 Polynucleotide encoding Xenopus anti-dorsalising morphogenetic protein useful to treat and diagnose conditions involving inappropriate tissue proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tha) sequence via binding of the compounds with the tha Sequence. The method comparises generating a compounds with the that sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, also described are: (1) a method of a coording to defined criteria. Also described are: (1) a method of defining a set of oligomucleorides (ONS) that modulate the expression of a that sequence via binding of the ONS with the that sequence comprising comparing a library of virtual compounds in silico according to defined criteria; and evaluating in silico the binding of the virtual ONS with the that according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of a method of defining of the compounds with the that. The methods can be used for the generation of synthetic compounds having defined physical, and identification of synthetic compounds having defined physical, confined or variety of nucleotide sequence-based technologies, e.g. tractable to a variety of nucleotide sequence-based technologies, e.g. the present invention

the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a compounds with the tNA sequence. The method comprises generating a compounds with the tNA sequence. The method comprises generating a compound with the tNA sequence via binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of defining a set of oligonucleotides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising a tNA sequence via binding of the binding of the virtual observation of criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical.

Compounds with the tNA. The methods can be used for the generation of the compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. This sequence is a PCR primer for DNA encoding the embryo-derived interleukin-related factor (EDIRF) of the invention, designated human EDIRF II. The EDIRF DNA and protein sequences (and their homologues), antibodies (Ab) specific for EDIRF, and other modulators are used: (i) in screening and detection assays, e.g. for chromosome mapping, tissue typing or forensic studies; (ii) in diagnosis, prognosis or monitoring clinical trials; and (iii) for treating or preventing EDIRF-related diseases (especially immune, haematopoietic, differentiative, developmental or inflammatory disease, including arthritis and psoriasis. The EDIRF coding sequence, or its fragments, are also useful as probes and primers (for detecting related sequences and disease-associated mutations, also for mutagenesis), for expressing recombinant EDIRF and as source of antisense, riboxyme and peptide nucleic acids for inhibiting translation of EDIRF-derived mRNA. EDIRF is used to raise Ab (useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human G-alpha-11 phosphorothioate antisense oligonucleotide SEQ ID NO:86.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, G-alpha-11; antisense oligonuclectide; inhibition; expression; phosphorothicate; ss.

thuman G-alpha-il is a member of the Gi subfamily of G proteins which is involved in hormonal inhibition of ademylyl cyclase and in the regulation of plasma membrane enzymes. The expression of G-alpha-il is altered in some tumours. The present sequence is a G-alpha-il antiense competution. The present sequence is a G-alpha-il antiense coligonalectie, which can be used to inhibit the expression of human G-alpha-il. The invention relates to antisense oligonaclectides represented in AAA10814-A1083, which can be used in the treatment of diseases or condition associated with the expression of G-alpha-il by modulating the may also be used prophylactically, e.g. to prevent or delay infection, infammation, or tumour formation. Furthermore, the antisense compositions inflammation, or tumour formation. Furthermore, the antisense composition of algonaclectides may also be useful in research and diagnostics, e.g. in detecting nucleic acids encoding G-alpha-il by conjugation of an enzyme to he oligonaclectide, kits using such detection means for detecting the level of G-alpha-il in the sample may also be prepared. Antisense oligonaclectides, which are able to inhibit specific gene expression, are often used to elucidate the inhibit specific genes. These antisense compounds are also used to distinguish between functions of various members of a biological pathway
                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense compounds targeting nucleic acids encoding human G-alpha-il useful for modulating G-alpha-il expression and for treating diseases associated with G-alpha-il expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    G-alpha-il; G protein; adenylyl cyclase hormonal inhibition; tumour; plasma membrane regulation; antisense composition; treatment; prevent; delay; infection; inflammation; tumour formation; research; diagnose; ss.
oligonucleotides may be useful for the treatment of diseases associated with G-alpha-11
                                                                                                                                                                                                                                                                                   Gaps

The present invention describes inhibitory antisense compounds of 8-30 nucleotides, targeted to a nucleic acid molecule encoding human G-alpha-11. AAZ19468 to AAZ19547 represent human G-alpha-11 phosphorothioate antisense oligonucleotides given in the present invention. The

Example 15; Col 41; 38pp; English.

```
The present sequence is that of the forward primer used in the real-time quantitative PCR amplification of cancer specific gene Proll4 (see AASSOSOIN) Proll4 mRNA expression is higher in prostate than any other healthy tissues examined, indicative of it being a diagnostic marker for diseases of the prostate, especially cancer. The invention provides ESTS and full-length contigs for GSGs (see AAZSASOSOIN). The GSGs, polypeptides encoded by them, and antibodies that specifically bind CSG are used in claimed methods for detecting, diagnosing, monitoring, staging, imaging and treating prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing, staging and monitoring the presence and metastases of prostate cancer especially useful for treating prostate cancer comprises measuring changes in cancer specific gene levels.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is one of a large number of antisense cligonucleotides designed to target different regions of the human CD44 mana. CD44 is a multifunctional human cell surface adhesion receptor. The oligonucleotides were analysed for effect on CD44 mana levels by quantitative real-time PCR analysis. Antisense oligonucleotides that inhibit CD44 expression can be used to treat CD44-associated conditions inhibit CD44 exprosiferative disorders, such as cancer, and inflammatory conditions, such as rheumatoid arthritis. The antisense compounds hybridise to CD44 nucleic acids, thus allowing sandwich and other assays hybridise to cD44 nucleic acids, the sequence has a phosphorothicate backbone and may be either an oligodeoxymucleotide or a chimaric oligonucleotide containing 2'-methoxyethyl (2'-MOE) wings and a deoxy app. The ISIS number given above corresponds to the oligodeoxymucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense compound, that inhibits the expression of human cell surface adhesion receptor CD44, for treating hyperproliferative disorders and inflammatory conditions, such as cancer and rheumatoid arthritis.

```
coding region of human RIP-1. RIP-1 (also known as RalBP1 and RLIP) is a Grasse activating protein (GAP) thought to be a downstream target of Ral. The invention relates to antisense phosphorothicate oligonucleotides with anti-infective, anti-inflammatory and cytostatic activity. The oligonucleotides are RIP-1 antisense inhibitors and are used in the diagnosis, prevention and treatment of conditions associated with RIP-1 expression. Conditions associated with RIP-1 expression include various
                                                                                                                                                                                                                                                                                                          This sequence represents an antisense oligonucleotide which binds to the
                                                                                                                                                                                                           Antisense inhibition of human RIP-1 expression, useful for diagnosing, preventing and treating conditions such as inflammation.

New antisense compounds that limit the expression of human TRADD protein, useful in the treatment and diagnosis of cancer, inflammation and septic

The intracellular protein TRADD has been identified as a critical link between tumour necrosis factor (TNF) receptor binding and downstream

Claim 3; Page 51; 85pp; English.

shock.

WPI; 2000-013267/01

Novel biallelic markers used to construct a high density disequilibrium map of the human genome.

```
AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3367, are not actually given a sequence in the Sequence Listing from the

kappa-B in the absence of TNF and dominant negative mutants of TRADD chappa-B in the absence of TNF and dominant negative mutants of TRADD chappa-B in the absence of TNF and dominant negative mutants of TRADD chock TNF-induced NF-Kappa-B activation. A second effect of TNF in many cell types is the induction of apoptosis (programmed cell death). TRADD overexpression has been shown to mimic TNF induction of apoptosis as well. Data indicates that TRADD and other downstream effector proteins care the rate limiting step of TNF action and would therefore serve as the most efficient targets for inhibition of TNF-induced events. Antisense oligonucleotides capable of inhibition of TNF-induced events. Antisense cliqued expression of TRADD by contacting human cells or tissues with the antisense compound may be used to treat a disease or condition associated with TRADD expression, for example, septic shock, inflammation, or cancer. TRADD antisense oligonucleotides of varying inhibitory capabilities are listed in GENESEQ records AAZ93438-Z93517. The antisense oligonucleotides exhibit enhanced inhibitory capabilities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              when they have 2'-MOE wings and a deoxy gap

New nucleic acid reference material comprising two reference sequences for use in the polymerase chain reaction and for verifying nucleic acid amplification reactions by acting as a control.

The specification describes a nucleic acid reference material, which comprises two reference sequences, each with a pair of primer binding sites which are the same except for the substitution of one or a few nucleotide bases. The reference material is used in the polymerase chain reaction (PCR). The reference material is used as a control for verifying nucleic acid amplification reactions. The reference material is designed to be used in isolation in PCR systems or simultaneously within PCR assays, to control for and allow the measurement of PCR specificity and sensitivity. Amplification reactions that can be verified include ligase chain reaction, gapped ligase chain reaction, strand displacement amplification, nucleic acid sequence based amplification and self-sustained sequence replication. The reference material is particularly useful where detection of tearget sequences in medical or environmental useful where detection of tearget sequences in medical or environmental subsommal RNA gene. A fragment of the 16S ribosomal RNA gene of L. pneumophila was used to produce a reference material of the invention

Example 1; Fig 1B; 54pp; English.

This invention describes a novel human betal-adrenoreceptor gene (I) that comprises 1-7 or more mutations, excluding the sequence with the cutations Alal45Gly or Glyl165Cys. The invention also describes (I) a method for determining predisposition to disease by genotyping DNA of (I) at one or more exchanged position and comparison with a reference of sequence; and (2) a new variant of the betal-adrenoreceptor (II) which include at least one of the amino acid changes Ser45Gly, Ala59Ser, Gly389Arg, Arg399Cys, His402Arg, Thr404Ala and/or pro418Ala, but of sectioning the sequence with a single amino acid exchange at positions or 389. Genotyping of (I) is used to determine predisposition to assessing severity of this condition. Gene (I) can be used for the following: (i) development of therapeutic agents, especially a new class of the condition. Gene (I) can be used for the collowing: (i) development of therapeutic agents, especially a new class of betal-adrenoreceptor (ant) agonists; (ii) construction of genes or vectors, especially for pharmaceutical development; and (iii) develop diagnostic kits, particularly for determining predisposition and individual responses to different betal-adrenoreceptor (ant) agonists, including predisposition to develop side effects and habituation

This invention relates to an antisense compound targeted to a nucleic acid molecule encoding a member of the human Rho family of small GTP binding proteins, where the antisense compound inhibits the expression of the member of the human Rho family. The invention includes antisense oligonucleotides AAF94680 - AAF94637 which target a RhoA nucleotide sequence, AAF94668 - AAF9465 - AAF94680 - AAF94680 - AAF9465 - AAF94677 - AAF94686 - AAF9475 which target a RhoC nucleotide sequence, AAF9470 which target a Rac i nucleotide sequence and AAF9475 - AAF94809 which target cdc42 nucleotide sequence. The antisense compound is useful for treating hyperproliferative conditions, especially cancer, abnormal wound healing or clotting conditions and isolamomial frapartusion or recoxygenation injury. The compound may also be used to diagnose the above conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       An antisense compound targeted to a nucleic acid molecule encoding a member of the human Rho family of small GTP binding proteins useful for treating e.g. cancer and ischemia.
                                                                                                                       Rho; GTP binding protein; phosphorothioate antisense oligonucleotide; RhoA; RhoB; RhoC; RhoC; Rac 1; cdc42; hyperproliferative condition; cancer; wound healing; clotting; ischaemia; reperfusion; reoxygenation;

                                                                                                                                                                                                                                                                                                                                                                                The sequence represents a sequencing primer for DNA encoding the Fusarium fungal enzyme, glucanase. Glucanase, endochitinase and exochitinase are polypeptides with cell-wall degrading activity, derived from Fusarium fungal genes. The associated nucleic acids can be used to produce transgenic plants which are resistant to plant pathogens, particularly Fusarium species. They can also be used to isolate homologous genes from fingi to obtain genes which protect host cells, including fund, bacteria and plants against related fungal pathogens. The polypeptides, especially chitinases and glucanases, are useful for degrading seafood waste, such as shells that contain chitin, or for chemical modification of chitin or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes methods of clustering members of a sample, involving applying a hierarchical clustering algorithm to the sample, members, determining the optimal number of clusters based on this and distributing the sample members into clusters using non-hierarchical culstering. The methods are useful in population based studies such as clinical trials, DNA fingerprinting and genetic profile analyses. The present sequence was used to demonstrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction;
                                                                                                                                                                                                                                                                                                                                                                                Genetic clustering by distributing members into optimal numbers of clusters determined by a hierarchical clustering algorithm or by paired-pair analysis of homozygous pairs in clusters got from non-hierarchical clustering.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Nyren P;

Detecting a base at a pre-determined position in a nucleic acid molecule, comprises performing primer extension reactions using base-specific detection primers in the presence of a nucleotide-degrading enzyme.

Example 1; Page 26; 59pp; English.

The invention relates to a novel method for synthesising a target base sequence-containing nucleic acids. The method comprises the formation of single-stranded nucleic acids, synthesis of complementary strand by annealing, and producing single-stranded nucleic acid from a target base sequence by the synthesis of a complementary strand by annealing of a complementary base sequence. The method is useful for synthesising a target base sequence-containing nucleic acids, which is applicable in detecting SNP (single nuclectide polymorphism) in genes, identifying genetic diseases, cancer and microorganisms. Such a method can be easily, rapidly and freely carried out without being influenced by contamination or complicated temperature control, but with improved reaction specificity, high accuracy and efficiency, operable at low cost. This

Example 3; Page 66; 107pp; Japanese.

The present invention relates to a method for detecting a base at a predetermined position in a nucleic acid molecule. The method comprises performing primer extension reactions using base-specific detection primers, each being specific for a particular base at the predetermined

ö position. The allele-specific (AS) primer extension assay method of the invention is useful for detecting an allele-specific base at a predetermined position in a nucleic acid molecule, for high throughput single nucleotide polymorphism (SNP) analysis, and for detecting mutations and genetic variations. The new method solves the deficiencies of previous methods by providing a method of allele-specific extension that allows accurate discrimination between matched and mismatched configurations, as well as reducing or eliminating false positive results observed in prior art. The use of two allele-specific primers increases the sensitivity by a factor of two because signals of two extensions are obtained. The present sequence represents a primer used in the examples Synthesizing target base sequence-containing nucleic acids constituting complementary base sequences against template by the LAMP method, applicable in identifying genetic diseases, cancerization and Gaps Synthesising; target base sequence; annealing; genetic disease; SNP, single nucleotide polymorphism; cancer; PCR; primer; ss. Detecting and differentiating between colon cell proliferative disorders associated with a gene or its regulatory regions comprises contacting a target nucleic acid in a biological sample obtained from the subject with

Claim 41; SEQ ID NO 112; 74pp; English.

The invention relates to a novel method for detecting and differentiating between colon cell proliferative disorders associated with at least one open or its regulatory regions. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or a series of reagents, where the reagent or series of reagents, where the reagent or series of dinucleotides within the target nucleic acid. The molecules of the invention demonstrate cytostatic activity whilst the method may useful for decerting and differentiating between colon cell proliferative disorders, including cancers such as colon adenoma and colon carcinoma. The PRA (peptide nucleic acid)-oligomers are useful as probes for determining cytosine methylation state or single nucleotide polymorphisms. The current sequence is that of the oligonucleotide of the invention which was used to analyse the CyG positions within the genomic DNA regions. This sequence is not shown within the specification but is taken from Wipoweb

Detecting and differentiating cytosine methylation state of genomic DNA, useful for diagnosing, treating prognosticating and/or monitoring lung cell proliferative disorders e.g. adenocarcinoma and squamous cell carcinoma.

Claim 15; SEQ ID NO 826; 58pp; English.

This invention relates to a novel method for detecting and differentiating between lung cell proliferative disorders associated with relates to ne gene and/or their regulatory regions. Specifically, it refers to a method comprising contacting a target nucleic acid in a biological sample with at least one reagent, wherein the reagent is able to distinguish between methylated and non-methylated CpG dinucleotides present in the target DNA. As such, it is possible to further differentiate and diagnose medical conditions including adenocarcinoma and squamous cell carcinoma, and their respective adjacent lung tissue. The present invention describes cytostatic oligomers and pNA-oligomers that are useful as probes for determining the cytosine methylation state or single nucleotide polymorphisms (SNPS) of the target sequence. This oligomulectide sequence is a primer oligomer used for the analysis of the contaction within genomic DNA, used in an exemplification of the

RESULT 664 ð 염 8 The present invention describes an isolated nucleic acid (I) comprising a single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of Salmo salara SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs; and (ii) a nucleic acid having nucleotide sequence that hybridises to call (ii) ar nucleic acid having nucleotide sequence that hybridises to call (i) or its complement under highly stringent hybridises to coditions. Also described: (I) an isolated oligonucleotide (II) comprising at least 1 contiguous nucleotides of a nucleotide sequence of S. salar SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, Cod polymorphic sites and seabass polymorphic sites or their complement; (2) a primer pair (III) sultable for use in PCR, comprising two (II) capable of inloticus microsatellites, Atlantic halibut SNPs, Cod polymorphic sites and seabass polymorphic sites, and determining (MI) the complishing a collection of candidate parent genotypes and comparising providing a parentage genotype of the candidate parent genotype, where each of the candidate parent genotype represents a distinct origin, and comparing a candidate parent genotype, where each of the candidate parent genotype and one of the candidate parent genotype and one of the candidate parent genotype identifies to the sample genotype and one of the candidate parent genotype identifies or a fish sample such as family salmonidae, S. salar, Tilapia, O. niloticus, rainbow trout, halibut, saebass and Atlantic cod, (II) is useful for detecting nucleic acid molecule comprising sp. in a sample, which hybridises to (II). (III) which is derived from nucleotide sequence of S. salar, Tilapia, on inloticus syste, and identifying nucleic acid molecule comprising a polymorphic sites, and identifying a micleic acid molecule comprising a microsatellite, O. niloticus SNPs, All derived from one (II) is useful for detecting nucleic acid molecule comprising a microsatellite sequence in sample, reparent parent parent parent parent sequence is sequence in the exempl Novel isolated nucleic acid molecule comprising single nucleotide polymorphism associated with fish, useful for forming PCR primers which are used for detecting single nucleotide polymorphisms in fish nucleic single nucleotide polymorphism; SNP; fish; Salmo salar; Orechromis niloticus; Atlantic halibut; microsatellite; cod; polymorphic site; seabass; salmonidae; Tilapia; rainbow trout; halibut; Oreochromis niloticus microsatellite primer SEQ ID NO:607. the invention. The method of the invention is for produced by the method of the invention is for producing capped RNA or RNA analogues. The method comprises reacting a RNA or analogue oligonucleotide with a phosphate addition agent to form a RNA or analogue oligonucleotide with a phosphate addition agent to form a RNA or analogue of is important for mRNA meturation, initiation of translation, and protects the mRNA against various RNases present in the cell. The capped RNA analogue is an influenza endonuclease aptamer, useful for treating or preventing an influenza infection in an animal. The synthetic capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are potent inhibitors of the cleavage of capped RNA by influenza endonuclease. They may be used to investigate viral and cellular mechanisms of transcription/translation, or mRNA maturation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mass spectrometry; diagnosis; detection; biological sample; infection; genetic disease; chromosomal abnormality; identification; heredity; pathogenic organism; telomerase activity; oncogene mutation; cancer-specific sequence; primer; ss.

```

```
A process has been developed for determining the sequence of a target nucleic acid. The process comprises: (i) generating at least two mucleic acid. The process comprises: (i) generating at least two mucleic acid. The process is used nucleic acid, and (ii) analysing F by mass spectrometry (MS). The sequences in AAV39483 to AAV39592 are specifically claimed primers for use in the mass spectrometric analysis of the above process. The process is used to detect genetic diseases (e.g. thanssemia, Duchenne muscular dystrophy, Alzheimer's disease, cystic fibrosis and many others) or chromosomal abnormalities (or predisposition); infections and cancers; also for establishing comparibility, and in genetic fingerprinting. Compared with known neuroblastoma, detecting telomerase, determining family relationships and HLA compatibility, and in genetic fingerprinting. Compared with known methods using MS, this process requires fewer specific reagents and is better suited to automation. Extended primers are shorter; primer annealing is more efficient and the process allows detection of many sequences simultaneously
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PorNA and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AAABGA15 to AAABG787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                              The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA86745 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         음
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method for obtaining a set of biallelic markers represented in AAX52533-X52632 and AAX52833-X52843 for use in constructing a high density equilibrium map of the human genome. The method involves (a) obtaining a nucleic acid library comprising genomic DNA fragments comprising the full genome or a portion (b) determining the order of genomic DNA fragments in the genome, (c) determining the cequence of selected regions of the genomic DNA fragments and (d) identifying nucleotides in the genomic DNA fragments and (d) identifying nucleotides in the genomic DNA fragments which vary between inviduals, thereby defining a set of biallelic markers. The methods can be used for identifying traits such as disease (e.g. Alzheimer's clisease), drug response, drug efficacy and drug toxicity. They can be used for selecting an individual for inclusion in a clinical trial. The method is used to map the position of genes in a genome (preferably the human genome). The sequences described in AAX2633-X52832 and AAX52844-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin BI. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinases cuter than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA83415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is sefficient in substant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                             New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent Kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves encoding a cyclin or cell-cycle dependent kinase other than CDK1,

                                                                    The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in

```
invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ66579 to AAZ7740 represent amplification have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haphoryping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agence acting on a disease states. Identification of the targets for the development of pharmaceutical agence acting on a disease as well as other treatment. N.B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention is concerned with antisense oligonucleotides containing a number of degenerate bases and with a modified backbone which can be used to direct cleavage of target RNA molecules. The use of degenerate bases reduces the risk of immune activation following injection into animals, which causes deleterious side effects associated with many therapeutic antisense oligonucleotides. Sequences AAC65029-C65077 are antisense oligonucleotides and PCR primers used in assays to demonstrate the effects of the sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                Antisense oligonucleotides containing degenerate and/or universal bases, and modified backbone linkages is useful to target therapeutic genes, preferably anti-apoptosis or chemoresistance genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Neurofibromatosis (NF1) genomic DNA sequencing primer #89.

The sequences represent neurofibromatosis type 1 (NF1) cDNA fragments and manalysis of the NF1 gen in mutation analysis of NF1. A create for mutation analysis of NF1. A method for mutation analysis of the NF1 gene involves isolating peripheral blood lymphocytes (PB1) of a patient, establishing Epsteing peripheral blood lymphocytes (PB1) of a patient, establishing Epstein. Sar virus (EBV) transformed B-lymphoblastoid cell line with isolated compared to the short-term culturing of PBL by phytohaemaggluinin (PHA) is then amplified and peptide fragments are obtained by in virus cynthesis inhibitor and immediately extracting RNA from the cultures. The synthesis inhibitor and immediately extracting RNA from the cultures. The conscription/translation of amplified fragments are obtained by in virus constructions consorted in virus is used for detection of frame shift, missense and silent mutations consorted in virus is useful in screening for NP1 control of any or agent can be identified by a screening process in which condition is monitored in virus using cell systems in which the defection of specific defects can be used to design defective NP1 gene is expressed. The sequences can be used to design defective NP1 gene is expressed. The sequences can be used to design defective NP1 protein and of specific defects of the various NP1 mutations that are considered in virus for reliable analysis of mutations that are difficult to detect due to unstable or wrong-spliced transcripts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, ribozyme therapy, hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoritasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antisporiatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar;
                                                                                                                                                                                                                                            Mutation analysis of NF1 gene by treating BBV transformed lymphoblastoid cell lines formed with lymphocytes of patient with protein synthesis inhibitor, and obtaining peptides by translating amplified RNA from cell

```
The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, antisickling, centratological, cytostatic, antiseborrheic, antidabetic, antisickling, ophthalmological, vylostatic, keratolytic and virucide activities, and cleaves RNA encoding (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, cleaves basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scar scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57877 to AAH67099 represent sequences used in the cxemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin, MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipisoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antipisoriatis; ophthalmological; keratolytic; gene therapy; virucide; actopic dermatitis; actinic keratosis; squamous cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (2). (1) can have antipsoriatic, christopathy. Neratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as positiasis, atopic dermatitis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic actionate, and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn is a such as a seloid, adhesion and hypertrophic or hypertrophic burn is a such as for the such as each in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a cribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, christophalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, cophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as postiasis, atopic dermatitis, actinic keratosis, squamous or basal cell cardinoma and viral or sebortheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy, sickle cell retinopathy, retinopathy, sickle cell retinopathy, retinopathy and retinol addresion and hypertrophic or hypertrophic burn scarring such as keloid, addresion and hypertrophic or hypertrophic burn and some the sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, ribozyme therapy, hairpin ribozyme, hammerhead ribozyme, recognition site; target, ribozyme binding site; eye disease; vulnerary; proliferative disease, skin disease, psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MVF; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a cucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to characological, cytostatic, antiseborrheic, antidiabetic, antisickling, characological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as pooriasis, atopic dermatitis, actinic keratosis, slope used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detechment, and for treating and preventing propertine and contracting and preventing propertine and contracting and preventing propertine and contracting and preventing propertine and contractine and con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation, cell-cycle dependent kinase; cyclin; MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a inflammation, matrix metallogracians of cytokine involved in inflammation, matrix metallogracians of CMPP), cyclin, cell-cycle chemation, matrix metallogracians of cytokine involved in inflammation, matrix metallogracies, or administering a nucleic acid segment encoding (I) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatclogloid, cytostatic, antiseborrheic, antidiabetic, antisiching, obthalmological, vulnerary, kratcloytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatciis, actinic keratcosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing carr. AAH$57977 to AAH$62099 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
antipsoriatic, dermatological, antiseborrheic, antidiabetic, virucide, antisickling; ophthalmological, keratolytic, gene therapy, viral wart, atopic dermatifis, actinic keratosis; squamous cell carcinoma, basal cell carcinoma, seborrheic wart, vitreoretinopathy; scar; sickle cell retinopathy; ss.

Binding molecule, HIV-1; human immunodeficiency virus type 1;

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsociatic, antisicaling, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, cophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [11] are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratoly can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing carring such as keloid, adhesion and hypertrophic or hypertrophic burn and cortical in the ô matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antieeborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss. ö The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative low significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. New variant of immunoglobulin variable domain for treating cancer, comprises complementary determining region added or substituted with heterologous receptor-binding portion of angiogenin, and framework regions flanking CDR.

Goudsmit J;

Example 1; Page 55; 86pp; English.

The present invention relates to variants of an immunoglobulin variable domain, where the immunoglobulin variable domain comprises at least one domain, where the immunoglobulin variable domain comprises at least one complementarity determining region (CDR), and framework regions flanking the CDR. The CDR is added or substituted with at least one binding complements, which is a receptor-binding portion of angiogenin heterologous to CDR and is a binding sequence from a binding site of a binding pair. The variants of the invention are useful as an antibody based approach to inhibiting angiogenin activity or angiogenesis. Vaccines comprising an effective amount of the variants can be used to induce an anti-idiotype response. The variants and nucleic acids encoding the variants are useful in the treatment or prevention of cancers (e.g. solid tumours) and other they also useful in gene therapy. AAS18461-AAS18482 represent PCR primers used for preparation of angiogenin constructs in the methods of the present invention

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intitation coodon, coding regalon, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjudinone. A composition of the invention has anctiniflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an preventing sensitivity to adenosine, reducing levels of adenosine receptor, producing sensitivity to adenosine, reducing levels of adenosine receptor, producing sensitivity to adenosine, reducing levels of ubjudinone or lung surfactant in a subject, s tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence date for this patent is not represented in the printed of form the form will be the form with the form will be the form of the form of the form of the form of the form of the form will be the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó

```
The present invention discloses a cDNA sequence of human repair gene DNA polymerase beta, which is a specific representation of DNA polymerase beta in oesophagus cancer. The protein coded by it has fully lost the DNA repair activity of DNA polymerase beta. It can be used for early diagnosis and gene therapy of esophagus cancer. This sequence represents a human DNA polymerase beta associated oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; NOVX; PCR; ss; metabolic disorder; cardiomyopathy; diabetes; ASD; hypertension; congenical heart defect; aortic stenosis; valve disease; putrial septal defect; atrioventricular canal defect; ductus arteriosus; pulmonary stenosis; subsortic stenosis; ventricular septal defect; VSD; tuberous sclerosis; scleroderma; atherosclerosis; infectious disease; backinson's disease; lumnue disorder; haematopoietic disorder; primer; haemophilia; hypercoagulation; Crohn's disease; cancer.

```
The invention relates to human polypeptides, termed NOVX, and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for diagnosing disease, and screening for potential therapeutic agents. The sequences are useful for treating metabolic disorders, cardiomyopathy, diabetes, hypertension, congenital heart defects, aortic stenosis, atraial septal defect (ASD), arrioventricular canal defect, ductus arterisous, pulmonary stenosis, subsortic stenosis, ventricular septal defect (VSD), valve diseases, tuberous sclerosis, scleroderma, atherosclerosis, obesity, infectious disease, anorexia, neurodegenerative disorders. Alzheimer's disease, Parkinson's disease, immune disorders, haematopoietic disorders, haematopoietic disorders, haematopoietic disorders, haemophilia, hypercoagulation, Crohn's disease and cancer. This sequence represents a PCR primer used to amplify a human NOVX polymucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Guo X, Kekuda R, Miller CE, Malyankar UM, Spytek KA;

New Unc-51, regulator of mitochondrial activity 1 and/or mitochondrial 2TM nucleic acids or polypeptides, useful for diagnosing, treating or preventing a metabolic or a mitochondrial disorder, e.g. obesity, bulimia or achexia.

New thrombopoietin synthebodies, useful for stimulating proliferation, growth, or differentiation of hematopoietic cells, for treating or preventing hematopoietic or immune disorders, e.g. thrombocytopenia.

Example 1; Page 73; 97pp; English.

Example 6; Page 74; 102pp; English.

The present invention describes a pharmaceutical composition comprising carriers, diluents and/or adjuvants, together with any of the following: a nucleic acid molecule of the Unc-51; regulator of mitochondrial activity 1 (ROWAL); and/or mitochondrial 2TM gene family (particularly Unc-51-like kinase), a polypeptide encoded by it, a fragment or variant of them, or an antibody, an aptamer or another receptor recognising them. Unc-51, ROWAL and 2TM proteins have anorectic, immunomodulator, antidepressant and antidiabetic activities, and can be used in gene therapy. The composition is useful for manufacturing an agent for detecting and/or verifying, disgorder, immunomodulator, antidepressant and antidiabetic activities, and can be used in gene therapy. The composition is useful for manufacturing an agent for preventing a metabolic disorder or a mitochondrial disorder, e.g. obesity, adipositas, eating/body weight disorders (e.g. bulimia nervosa or anorexia nervosa), cachexia (exp. bulimia nervosa or anorexia nervosa), cachexia (exp. bulimia nervosa or anorexia nervosa), cachexia (exp. bulimia nervosa or anorexia nervosa), cachexia (exp. bulimia nervosa or anorexia nervosa), cachexia (exp. bulimia nervosa or anorexia nervosa), cachexia (exp. bulimia nervosa or anorexia nervosa), cachexia (exp. bulimia nervosa or anorexia nervosa), cachexia (exp. bulimia nervosa or anorexia nervosa), cachexia (exp. bulimia nervosa or anorexia nervosa), or disorders related to Ros production and others in cells, cell mitochondrial activity and so contributes to membrane stability and confort the function of organelles (preferably mitochondria). The present sequence represents a PCR primer for mouse Unc-51-like kinase I (ULK-1), which is used in an example from the present invention

The invention discloses a variant of an immunoglobulin (IG) variable heavy or light chain domain that comprises at least one complementarity determining region (CDR) and framework regions flanking the CDR. The CDR also has added or substituted to it, at least one binding sequence which is heterologous to the CDR and is an antigenic, agonistic sequence which is heterologous to the CDR and is an antigenic, agonistic sequence from a thromopoletin (TPO) receptor (MPL) binding sequence. The antigenic sequence can be a binding sequence heterologous to the CDR, a cytotoxic respense or a combination of each. The variant or thromopoletin synthebody, pharmaceutical and vaccine compositions are useful for synthebody, pharmaceutical and vaccine compositions are useful for stimulating proliferation, growth or differentiation of haematopoletic cells, particularly platelet progenitor cells. The variants are also useful for treating or preventing hemmatopoletic or immune disorders constituting from chemocherapy, radiation therapy, or bone marrow transfusions (e.g. thrombocytopenia or disseminated intravascular committed and vacuured committed and variance of the mobilisation and ex vivo expansion of stem cells and committed and vacuured committed and vacuured committed and vacuured committed and vacuured committed and vacuured committed and vacuured committed and vacuured committed and vacuured committed and vacuured committed and vacuured committed and vacuured and vacuured committed and vacuured committed and vacuured committed and vacuured and vacuured and vacuured committed and vacuured committed and vacuured and v committed precursor cells for autologous and allogeneic transplantation as well as for the expansion of stem cells for gene therapy. They are also useful as diagnostic or analytical reagents for studying the function of thrombopoietin and its receptor in vivo or in vitro. The sequence presented is the PCR primer, VHP3, which was used to construct variable heavy chain region gene containing the MPL binding sequence of 0

rainbow trout, halibut, seabass and Atlantic cod. (II) is useful for detecting nucleic acid molecule comprising SNP in a sample, which involves contacting the sample containing nucleic acids with one or more (II) derived from nucleotide sequence of S. salar SNPs and O. niloticus SNPs, and identifying nucleic acid that hybridises to (II). (II) is useful for detecting nucleic acid molecule comprising a polymorphic sequence in a sample, comprising contacting the sample containing nucleic acids with one or more (II) which is derived from O. niloticus microsatellite, O. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic sites or seabass polymorphic sites, and identifying a nucleic acid that hybridises to (II). (III) is useful for detecting nucleic acid molecule comprising a microsatellite sequence in sample. The present sequence is used in the exemplification of the present invention.

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of the SCD (stearoyl-COA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD
                                                                                 short interfering nucleic acid; siNA; downregulation; inhibition; SCD; stearcyl-CcA desaturase; RNA interference; anorectic; antidiabetic; antiarteriosclerotic; cytostatic; virucide; obesity; diabetes; atherosclerosis; cancer; viral infection; drug screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New short interfering nucleic acid, useful e.g. for treatment diagnosis of obesity or diabetes, downregulates expression of stearoyl-CoA desaturase gene.
Stearoyl-CoA desaturase siNA oligonucleotide SEQ ID NO:414.
                                                                                                                                                                                                                                                                                       genetic engineering; pharmacogenomic; gene mapping; ss.

genes in cells, tissue explants or organisms by introduction of siNA, (2) kits for in vitro or in vivo delivery of siNA, (3) conjugates and/or complexes of siNA, and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiatreriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD genes, in cells, tissue explants or organisms, e.g. for treating obesity, diabets (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.

New short interfering nucleic acid, useful e.g. for treatment diagnosis of obesity or diabetes, downregulates expression of stearoyl-CoA desaturase gene.

Example 3; SEQ ID NO 124; 139pp; English.

The present invention describes a short interfering nucleic acid (siNA) that downregulares expression of the SCD (stearoyl-CoA desturnase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siNA; (2)

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for

modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs have cytostatic, anorectic, antidiabetic, antinflammatory, antiasthmatic, immunosuppressive, antibacterial, antirheumatic, antipsoriatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity, diabetes types I and II, a wide range of tumouurs, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            short interfering nucleic acid; siNA; downregulation; inhibition; mitogen-activated protein kinase; MAP kinase; MAPK; RNA interference; cytostatic; anotectic, antidiabetic; antidiflammatory; antiasthmatic; immunosuppressive; antibacterial; antirheumatic; antiarthritic; antipsoriatic; gastrointestinal; obesity; diabetes; tumour; inflammatory disease; asthma; septic shock; rheumatoid arthritis; perstansis; inflammatory bowel disease; drug screening; genetic engineering; pharmacogenomic; gene mapping; ss.

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a mitogen-activated protein kinase (mAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or corganisms by introduction of SiNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of SiNA; and (4) corgustes that express siNA and cells containing these vectors. MAPK siNAs vectors that express iNA and cells containing these vectors. MAPK siNAs containthritic, antiporiatic and gastrointestinal activities. The MAPK antiasthmatic, antiporiatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I complication and validation; psoriasis and inflammatory bowel complexes. They can also be used for drug screening; diagnosis; target disease). They can also be used for drug screening; diagnosis; target coloning fication and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide colonymorphisms). The present sequence represents a MAPK siNA which is used the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated nucleic acid encoding hepatocyte nuclear factor 1-alpha and 1-beta - useful for detecting susceptibility for non-insulin dependent diabetes, especially maturity-onset diabetes of the young.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

This is a reverse PCR primer designed for use with a forward primer (see AAV52667) in the PCR amplification of exon 1b and the flanking introns (see AAV52655) of the human hepatocyte nuclear factor-4 alpha (HNF-4 alpha) gene (see AAV52687). Mutations of the HNF-4 alpha gene have been identified by amplifying (see AAV5265-665) and sequencing the appropriate exon. The invention concerns the identification of genes responsible for non-insulin dependent diabetes mellitus (NIDDM) for use in diagnostics and therapeutics. It demonstrates that the MODY1 (maturity-onset diabetes of the young) locus is the HNF-4 alpha gene. Analysis of mutations in the HNF-4 alpha gene can be diagnostic for diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligo-nucleotide primers for polymerase chain reaction amplification -
which detect DNA polymorphisms and are useful for prenatal and paternity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is a PCR primer which is used (with AAQ32806) to characterise a unique microsatellite repeat polymorphic DNA marker which has a high polymorphism information content. The marker is useful for human individualisation, in forensic screening, in paternity and prenatal screening as well as in genetic mapping. (Updated on 25-MAR-2003 to

The method comprises obtaining polymucleotide regents comprising the repeat polymorphisms in an amount effective for testing and amplifying the segments by a PCR procedure using a pair of oligonucleotide primers capable of amplifying the polymorphism containing sequence. The amplified sequences are resolved using PAGE and the resolved sequences are compared by autoradiography to observe the differences in migration pattern due to length variation. The polymorphic provide a fast and accurate test for measuring the subtle differences in individuals in eg. forensic screening, paternity and differences in individuals in eg. forensic screening, paternity and differences in screening and genetic mapping. The polymorphic microsatellite repeats based on previoually sequenced human genes. (Updated on 25-MAR-2003 to correct PN field.)

Primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T19001-T56837) were obtained from 3 -directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers 41007-8 amplify clone pm.172 which comprises the GS HUMGS001087 (T20087), located on chromosome 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hepatitis C virus; HCV; non-A non-B; HC-G9; treatment; PCR sense primer; nt7792-7811; ss.

of hepatitis C.

AAQ91517 and AAQ91518 are a pair of primers for the PCR amplification of AAQ79140 the hepatitis C virus (HCV) gene HC-G9 cDNA, it encodes the protein described in AAR67588. Both the cDNA and protein can be used in the treatment of HCV infection

                                                                                                                                                                                                                                                                                                                                                                                                             à
                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
cDNA and then the cDNA was used as the template for PCR amplification of various cytokines using the primers in AAT38964 AAT39005. To confirm the identity of amplified cDNA, digoxigenin- labelled probes specific for each cytokine (see AAT39006-13021) were hybridised with Southern blots of amplified sequences. The expression profile for regressing and non-regressing warts was established and compared to cytokine expression patterns in normal cervical tissue. Results showed that interleukin 12 is barely expressed (if at all) in non-regressing warts, but is expressed in regressing warts. This suggests a central role for IL-12 in wart regressing univant) for treating papilloma virus-associated lesions such as condyloma acuminata (anogenital warts) caused by human papilloms virus type 6 (HPV-6) and/or HPV-11 and more generally for treatment of tumours associated with HPV-11 and more generally for treatment of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a PCR primer (nt 717-738) for the human steroidogenesis acute regulatory protein (hStAR) orDA. The hStAR gene can be analysed for mutations to detect (e.g. prenatally) genetic defects associated with congenital lipoid adrenal hyperplasia (CAH), or its transmission to children. CAH can be treated by protein or gene replacement therapy, which can also be used to prevent or treat hypercholesterolaemia. A human adrenal cortex oDNA library was screened

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
with a mouse StAR probe to isolate a 1.6 kb insert, including an ORF for a 2B5 realatue protein. When it was Gloned into pSPORT and expressed in COS-1 cells cotransfected with pP9450 and pADX, it increased the level of pregnenolone synthesis from cholesterol or 20-alpha-hydroxycholesterol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used to develop genomic maps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic comparisons to be made between more species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotide primers amplifying gene regions conserved among mammals - useful for developing genomic maps, isolating clones and making cross-species comparisons.

Sequence 20 BP; 3 A; 0 C; 9 G; B T; 0 U; 0 Other;

A method has been developed for the detection of polymorphism (mutations) in the S182 gene. The mutations are detected using selected mismatch polymerase chain reaction (PCR) primers derived from intronic sequences of the gene. The present sequence represents a specifically claimed PCR primer. Mutations in the S182 gene indicate that a subject is susceptible to late onset Alzheimer's disease. The method allows rapid analysis of many samples by PCR, restriction enzyme disestion and gel electrophoresis. Use of intronic sequences allows mutations to be detected in splice donor and acceptor sites (this would be almost impossible without intronic primers)

Diagnosing Alzheimer's disease by detecting polymorphism in the S182 gene - using mismatch polymerase chain reaction primers derived from intronic sequences.

RESULT 70 AAT93934/

Genetic screening for diseases associated with coronary arterial spasm by assessment of the occurrence of specific mutation(s) of the endothelial nitrogen monoxide synthase gene.

The present sequence is an exon 23 primer for the polymerase chain reaction-single stranded conformational polymorphism (PCR-SSCP) analysis of the endothelial nitrogen monoxide synthase (eMOS) gene. The PCR-SSCP analysis was used in an example of genetic screening method for diseases associated with coronary arterial spasm, which comprises determining if or more specific nucleotides in the eNOS gene have been substituted, specifically gasqu; c7747, T(-786)C, A(-922)G and T(-1468)A. Screening for diseases associated with coronary spasm, e.g angina pectoris, cannot be easily carried out by existing methods, this method allows rapid and

                                                                                                                       Immortalised, human, prostate epithelial cell line - useful as model in epithelial cell oncogenesis studies, particularly for developing products for diagnosis and therapy of prostate cancer.
                                                                                                                                                                                                                                                                          The present sequence is a primer for the PCR amplification of the Ank microsatellite marker, which is polymorphic DNA marker that can be studied for the detection of loss of heterozygosity on chromosome 8pl2-21. The primer was used in the development of a novel isolated, immortalised, malignant, human, adult prostate epithelial cell line, which can be used as a model in epithelial cell oncogenesis studies. The cells can be used in diagnosis and therapy, and to elicit an immune response to treat or prevent the recurrence of prostate cancer, i.e. a prostate cancer vaccine. They can also be used to produce antibodies for administration to prostate cancer patients, and to screen for potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human calpain protein and related DNA - useful for drug screening and treating cancer, stroke, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

RESULT 706 AAV04423/C

The present sequence is a primer for human calpain cDNA. Calpain is a

```
The PCR primer API1 is designed from one of the following sequences; the porcine retrovirus Tsukuba-1 cDNA, the genome of a defective porcine retrovirus found in PK-15 cells and a retrovirus from miniature swine.

The primer has also been used as a sequencing primer. Fragments generated from the amplification of such viral sequences as the GAG, POL and ENV viral is contrained to screen organs for porcine retroviruses or prior to xenotransplantation. Transplantation can increase the likelihood of retroviral activation if intact and infectious proviruses are present. The porcine retroviral sequence can be used to generate probes to determine the level (e.g. copy number) of intact (i.e. potentially replicating) porcine provirus sequences in a strain of xenograft cransplantation denors. It can be used to determine the histological localisation of activated retrovirus. Using Polymerase Chain Reaction DNA contraintation (PDO) on blood monomuclear cells, infectivity tirration and susceptibility testing can be performed. Ultimately animal donors without intact porcine retroviral sequences or with a lower copy number of viral
                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid from porcine retro:viruses - used for detecting viruses in transplant or other tissue and for assessing risk of transmitting
human leukocyte derived calcium dependent cysteine protease, which can used to screen for compounds that activate or inhibit its proteolytic activity. Calpain DNA can be used to treat or prevent cancer, cerebral apoplexy, cerebral infarction, subarachnoid haemorrhage, Alzheimer's disease, myodystrophy, cataracts, ischaemic heart disease, atherosis, arthritis or collagen disease

results from a G to A change in codon 120 in exon 5 of the presentin (PS -1) gene. Mutations in the PS-1 gene on chromosome 14 have been shown to cause a significant proportion of early-onset, autosomal dominant transmembrane domain (TM2). This mutation is virtually impossible to transmembrane domain (TM2). This mutation is virtually impossible to transmembrane domain (TM2). This mutation is virtually impossible to transmembrane domain (TM2). This mutation is virtually impossible to transmembrane domain (TM2). This mutation is virtually impossible to transmembrane domain (TM2). This mutation is virtually impossible to transmembrane domain (TM2). This mutation is near the second putative intron-exon boundary in genomic clones. The primers are used in a new method for diagnosing the likelihood of developing a chronic neurological disorders comprises detecting the presence or absence of PS-1 isoforms or of DNA encoding PS-1 isoforms in the subject. The methods which block or alter synaptic transmission in head injuries. They can also be used for the prognosis and treatment of beta-amyloid related diseases such as early- and late-onset Alzheimer's disease, cortical Lewy body disease, parkinson's disease and patients with vascular and cerebrovascular disease which predispose to these diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Presenilin gene; PS-1 gene; early-onset Alzheimers disease; polymorphism; intron; splice site; diagnosis; beta-amyloid related disease; PS-1 isoforms; exon 5; TW2; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Y chromosome; integrity; chromosome locus; primer; amplification; PCR; polymerase chain reaction; fertility; azoospermia; oligospermia; primetrile; diagnoss; DYS219; DYS219; DYS211, DYS31, DYS13; DYS11, DYS211, DYS211, DYS13; DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, DYS11, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAT68125-T68336 are a set of primers used in a method for assessing the integrity of a Y chromosome. The primers are capable of priming the chromosome loci: DYS201, DYS198, DYS199, DYS196, and MIC2. The method can be used to rapidly and reproducibly assess the integrity of specific regions of the Y chromosome that are associated with male fertility. It can be used to assess the integrity of the Y chromosome in males exhibiting azoospermia or oligospermia (no or very little spermatozoa in the semen) or to assess the genotype of infance of phenotypically ambiguous sexuality. The method can also be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Assessing integrity of Y chromosome - by amplification of selected human chromosome loci by multiplex PCR and comparison with normal control DNA.

AAV00264

PS-1 gene PCR primer 5.

```
The present invention describes a nucleic acid segment comprising at least 10 contiguous nucleotides from a vegetal sequence including a polymorphic site which is a single nucleotide polymorphic site which is a single nucleotide polymorphic on (SNP), or the complement of the segment. Also described are: (1) an allele-specific oligonucleotides hybridising to segment, or their complements, and (2) a method of analysing nucleic acids from a subject, by determining if a base is occupying any one (or a set) of polymorphic sites in 261 sequences derived from six maize lines (see AAV47701 to AAV47961). The segments are useful in fingerprint analysis in plants to determine which polymorphisms are present, which strain a plant belongs to and to distinguish between strains. The polymorphisms may correlate with phenotypic traits (e.g. plant growth rate or crop yield), and the segments are useful to determine the presence/absence of particular traits. The segments are also useful in marker assisted back-cross techniques to select plants with the existence/absence of particular traits. The segments are also useful in marker assisted back-cross techniques to select plants with a higher percentage of recurrent parent to a back-cross population. Segments incorporate SNPs which occur more frequently than other polymorphism types and are therefore more likely to be located close to genetic loci of interest, different forms of characterised SNPs are also often easier to detect than other polymorphism types and are selected on 27-AUG-2003 to be a select invention as markers and PCR primers. (Updated on 27-AUG-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vegetal sequences including single nucleotide polymorphism - useful, e.g. to determine polymorphisms in plants, determine strain in plant breeding and to correlate polymorphisms with phenotypic traits.

This novel PCR primer is one of a pair (the other being AAV00265), used in the amplification of the PS-1 gene (exon 5). Three mutations were identified at codon 139, 143, and 146 arising prom a A to G transition (M139, 1143F, and M146V). The variant of the PS-1 and S182 gene can be diagnosis and treatment of other forms of dementia giving rise to progressive intellectual deterioration closely resembling the dementia progressive intellectual deterioration closely resembling the dementia associated with Alzheimer's disease, and for which treatment is a vaciated with Alzheimer's disease. Identification of the mutants provides strong evidence that mutations in the S182 gene are the cause of early onset Alzheimer's disease in Chromosome 14-linked pedigrees, and it is therefore possible to develop models of Alzheimer's disease using transgenic model systems and/or whole cell systems containing the mutants. These models can be used to screen and evaluate the efficacy of drugs in treating Alzheimer's disease, and enable the investigation of S182 biochemistry and its relationship to Alzheimer's disease to provide a basis for rational drug design
 Variant S182 or PS-1 gene associated with Alzheimer's disease - with mutation at codon 139, 143, 267, 280, 146 or 269, useful in early-onset Alzheimer's diagnosis and to develop models for drug testing.

AAZ37473-237738 represent human mdm2 phosphorothicate oligonucleotides. AAZ37411, AAZ37727, AAZ37739, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or postiasis, fibrosis, atherosclerosis or restenosis
 New antisense compounds used to treat eg. hyperproliferative conditions
 Human mdm2 gene; proliferation; tumour; phosphorothioate; p53; cancer; antisense; modulation; oligonucleotide; expression; inhibition; hyperproliferation; blood cancer; brain cancer; breast cancer; lung cancer; soft tissue cancer; psoriasis; fibrosis; atherosclerosis; rescenosis; ss.

 AAV22531-89 represent antisense oligonucleotides which are targeted against the mRNA of the R1 subunit sequence of ribonucleotide reductase. Aberrant expression of the R2 gene, which encodes the second subunit of the ribonucleotide reductase. Which encodes the second subunit of the ribonucleotide reductase gene, can determine the malignant characteristics of cells. Suppression of R2 and R1 gene expression was found to reduce transformed properties of tunnour cells The antisense oligonucleotides can be used for modulating tumour cell growth, or for inhibiting tumour cell proliferation. They can also be used for increasing the sensitivity of neoplastic cells to chemotherapeutic drugs increasing the sensitivity of neoplastic cells to chemotherapeutic drugs oligonucleotides may be used to treat proliferative disorders including leukaemias, lymphomas, sarcomas, melanomas, various other forms of cancer, papillomas, arthrosclerosis, psoriasis, polythemia, mastocytosis, autoimmune diseases, angiogenesis, bacterial infections and viral infections (including HIV hepatitis, or herpes infections)

 AAV66445) were used in experiments to determine the effects of CART antisense oligonucleotide (see AAV66444) and one sense oligonucleotide (see AAV66445) were used in experiments to determine the effects of CART antisense oligonucleotides on the cocaine dose-response curve of rats. CART peptides (see AAW61337-45) are suggested to be neurotransmitters or neuromodulators in circuitry related to psychostimulant drug action. Administration of CART antisense oligonucleotides into the nucleus accumbens bilaterally depressed the locomotor response of rats to cocaine, but statistically significant results were not obtained. Bilacative peptides (see AAW61337-39 and AAW8134-45) derived from rat and human CART are used in claimed methods for modulating food consumption in an animal or human to which they are administered. Antagonists and
 AAV73084-V73145 are oligomers used in a method to detect a single-base mutation in a human ras oncogene. These probes comprise 12-43 nucleotides of formula 5'-B-Q-D-3', Q = 3 nucleotides complementary to the mutated codon, and B and D each = 0-20 nucleotides complementary to the ras sequences flanking the mutated codon. The probes are useful for detecting cancers associated with point mutations
 antibodies raised against the peptides are also used in claimed methods for modulating body weight disorders, attention deficit hyperactivity

 PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs anchode polygeptides (see AAX16759-4737949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, pepidymitis, cervicitis, salpingitis, perimpatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogramulomatosis. The polypeptides of the invention may be of use in treating these

PCR primers AAX26713-14 represent PCR primers used to amplify part of the TSA2004 gene. The specification describes a human pancpin gene. The phancpin gene encodes a protein branclogous to the serine protease inhibitor of serpin. The products may be used for gene therapy, e.g. treatment of cancers. The pancpin gene can be formulated into a drug composition for gene therapy of pancreatic cancer/tumour and for inhibition of its metastasis to suppress further malignant transformation and proliferation. Such genes can also be applied in clarifying, diagnosing, preventing and treating pancreatic cancer and its metastasis PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs aencade polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perimpatitis, barkholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allelect appecipic amplification assay for determining the identity of a nucleotide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its constillity to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease ö ó PG1 gene; biallelic marker; PCR primer; PG1-related biallelic marker; cancer; prostate cancer; diagnosis; therapy; prostate specific antigen; Use of a prostate cancer associated gene and biallelic markers derived Gaps Gaps ö ö 1.6%; Score 13.2; DB 1; Length 20; 83.3%; Pred. targets a region of the murine tumour necrosis factor alpha (TNFalpha)

targets a region of the murine tumour necrosis factor alpha (TNFalpha)

concloride sequence. TNFalpha is an important cytokine that plays a role nucleotide sequence. It is produced mainly in macrophages and monocytes in response to infection, invasion, injury or inflammation. Overexpression of TNFalpha can result in disease states, particularly in infectious, inflammatory and autoimmune diseases. The invention relates to antisense oligonucleotides, such as that represented by the present sequence which are capable of modularing the TNFalpha gene expression. The also optionally contain at least one 2'-O-methoxyethyl modification. The oligonucleotides are useful for modulating the expression of human cells and tissues, reducing a human cell inflammatory response, reducing the blood glucose level in a human and treating a human having a disease or condition associated with TNFalpha. Examples of
 Antisense oligonucleotide, phosphorothioate, TNFalpha, cytokine, inhibit, tumour necrosis factor alpha, inflammatory bowel disease, diabetes, themmatorid arthritis, infections disease, multiple sclerosis, hepatitis, panoreatitis, atopic dermatitis, allograft rejection; autoimmune disease,
 Oligonucleotide for treating diseases associated with human tumor necrosis factor-alpha (TNF-alpha) such as, diabetes and rheumatoid arthritis, comprises nucleotide sequence complementary to intron of
 Murine TNFalpha antisense oligonucleotide ISIS# 15926.

 The invention relates to a method of chemopreventing cancers sensitive to chemopreventative composition of a sufficient amount of a cancer chemopreventative composition comprising 4'-bromoflavone is a member of a family of compounds that induce phase II enzymes involved in the metabolic detoxification of xanobiotic compounds in mammals. One such phase II enzyme is quinone reductase. This enzyme promotes obligatory 2 electron reductions of quinones thus preventing promotes obligatory 2 electron reductions of quinones thus preventing nucleotides. Primers AAAII138-AII139 were used to detect quinone reductase mRNA expression in cells before and after treatment by the method of the invention. Primers AAAII140-AII141 were used to detect the rat beta-actin gene as a control for the mRNA detection step. The methods are used to prevent tumour growth and to suppress the initiation of cancers including carcinomas
 disease, multiple sclerosis, pancreatitis, rheumatoid arthritis, infectious disease, hepatitis, atopic dermatitis or allograft rejection. The antisense oligonuclectides are also useful for modulating the function of a selected nucleic acid sequence in adipose tissue
 diseases associated with TNFalpha include diabetes, inflammatory bowel

The invention relates to 40 human secreted proteins (AAY94981-Y95020), and ONNA sequences encoding them (AAA23423-A23462). The secreted proteins of the invention include those that are thought to be only partially secreted, i.e., transmembrane proteins. The proteins of the invention may exhibit one or more activities selected from the following: cytokine activity, cell proliferation, differentiation; immune modulation; haematopoiesis regulation; tissue growth activity, activin/inhibin activity; ohemocratic/chemokineinc activity; haemocratic/chemokineinc activity; and tumour inhibition activity. The proteins may be administered to patients as vaccines, and the nucleotides
 may be used as part of a gene therapy regime. Diseases or conditions that may be treated using the proteins or nucleotides of the invention include autoimmune diseases; genetic disorders; haemophilia, cardiovascular diseases; cancer; bacterial, fungal and viral infections, especially HIV; multiple sclerosis; rheumatoid arthritis; pulmonary inflammation; Guillain-Barre syndrome; insulin dependent diabetes mellitus; and allergic reactions such as asthma and anaemia. They may also be used for treating wounds, burns, ulcers, osteoporosis, osteoarthritis, periodontal diseases, Alzheimer's disease, parkinson's disease, and amyotrophic lateral sclerosis (ALS). Proteins with activinibin activity may additionally be useful as contraceptives, nucleic actid
 Human, secreted protein, cancer, tumour, cardiovascular disorder, blood disorder, haemophilia; autoimmune disease; diabetes; inflammation, infection; fungal; bacterial; viral; HIV; allergy, arthritis; neurodegenerative disease; asthma; contraceptive; hybridisation probe;

amplifying target DNA using polymerase chain reaction in a reaction matter discussed amplifying target DNA using polymerase chain reaction in a reaction mixture including a triphosphate decoxymucleoside labelled with a mixture including a triphosphate decoxymucleoside labelled with a mixture including a triphosphate despended with the endonuclease Cleavase I, pattern visualised through band analysis. The invention includes a method for the use of DNA fragments internally labelled with fluorocromes for the determination of alterations of a target DNA based on the conduclease activity of the enzyme Cleavase I. The method is useful for determining alterations in DNA sequences such as mutations, deletions, insertions, substitutions or variations in the nucleotide sequence. The method is useful for analysis of germinal or somatic mutations in genes method diseases, fine characterisation of microczanisms and in the sound of polymorphism and allelic frequencies. The prisent sequence represents a BRCA1 specific PCR primer. The primer is used in an example of the method for mutational analysis of the BRCA1 gene
 Determination of DNA sequence alterations for analysis of nucleotide variations, mutations or polymorphisms, comprises using the endonuclease Cleavase I and internal labeling of DNA fragments.

·;
 AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their muclectide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3066, 3157, 3227, 3297 and 3167, are not actually given a sequence in the Sequence Listing from the

AAZ34893/c g The invention relates to a novel method of inducing apoptosis in a target cell by inhibiting the expression or function of a Notch protein while the cell is undergoing differentiation. The invention also relates to proapoptotic compositions comprising a differentiation- inducing drug and an agent which inhibits the expression or function of a Notch protein.

Notch proteins play a role in the determination of cell fate. Many transformed cells retain the capacity to undergo terminal differentiation when treated with differentiation-inducing drugs, such as hexamethylene bisacetemade (HTMBA). This approach has been clinically tested as a potential cancer therapy, but treatment with HTMBA-type drugs alone can coadministration of HTMBA and either Notch antisense oligonucleotides or anti-Notch monoclonal antibodies enhances differentiation to a greater canti-Notch monoclonal antibodies enhances differentiation to a greater extent than HTMBA alone, meaning that the amount of HTMBA administered to a cell fate determining function of a Notch protein in the target cell at a time when the cell is undergoing differentiation induces apoptosis. The method and compositions are useful for inducing apoptosis in tumour cells which overexpress Notch for the treatment of Cancer that may be treated include cervical cancer, breast cancer and melanoma, and compositions are useful for inducing apoptosis in tumour cells which overexpress Notch-1 expression. The method and compositions may also be used to immunotased branscriptase-PCR (RT-PCR) concers used in an exemplification of the invention to generate both human and murine Notch-1 connect reverse transcriptase-PCR optimizer used in an exemplification of the invention in human and murine of the method of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the used i Induction of apoptosis in target cells e.g. tumor cells to treat cancers, by inhibiting a cell fate determining function of a Notch protein whilst the cell is undergoing differentiation. This invention describes a novel avian-paramyxovirus cDNA (1) which comprises a nucleic acid sequence corresponding to the 5' terminal end of the generation of an infectious copy of avian-paramyxovirus allowing the generation of an infectious copy of avian-paramyxovirus. The cell line is useful for the production of infectious lentogenic NDV (Newcastle Disease virus) without the addition of exogenous proteolytic activity. Also it is possible to generate a stable transfected cell line that expresses the wild-type F protein in the virus envelope therefore providing infectious particles, useful in the form of a vaccine, especially against respiratory and/or gastrointestinal diseases. NDV can be easily cultured to very high titers in embryonated eggs. Mass culture of embryonated eggs is relatively consorted by mass application methods e.g. drinking water or by spraying or by aerosol formation. The natural route of infection is by the respiratory and/or gastrointestinal tract which are also the major routes of infection of many other poultry pathogens. NDV can induce local immunity despite the presence of circulating material antibody. AZ4461927-Z44609

The present sequence is an antisense oligonucleotide directed against the manA encoding the R1 component of mammalian ribonucleotide reductase. Ribonucleotide reductase catalyses the conversion of ribonucleotides to their corresponding deoxyribonucleotides and thus plays an important role in DAN synthesis and cell proliferation. Regulation of ribonucleotide reductase is altered in cultured malignant cells and increased levels of R2 protein and R2 mRNA have been found in pre-malignant and malignant tissues as compared to normal control tissue samples. The present antisense sequence is therefore useful for inhibiting tumourigenicity of neoplastic cells and inhibiting medastasis of tumour cells. It is also

 Diagnosing a skeletal disorder e.g. osteoarthritis or osteoporosis, by measuring level of regulator or marker factors such as specific cytokines or interleukins involved in bone remodeling.
 The present invention describes a method developed for predicting or diagnosing a skeletal disorder (SD) comprising comparing the measured or estimated level of mRNA expression for a regulator or marker of bone remodeling from a body tissue or fluid sample (S) to a standard level. The method is used for diagnosing osteoporosis or osteoarthritis from tissue or fluid samples (containing a cellular component) by assaying for levels of specific markers in vivo and comparing the level to a standard. The method can be carried out on blood or urine samples. The present sequence represents a PCR primer used in an example from the present

New antisense compound for inhibiting the expression of signal transducer and activator of transcription 3 (STAT3) in cells or tissues and treating diseases or condition associated with STAT3, such as rheumatoid arthritis and cancer.

Example 2; Page 46; 104pp; English.

The present invention describes an antisense compound (1), 8 to 30 nucleobases in length, that is targeted to a nucleic acid molecule encoding STAT3 (Signal Transducer and Activator of Transcription) and which inhibits the expression of it. (1) has antiinflammatory, antitheumatic, cytostatic and immunostimulatory activities. (1) is used for inhibiting the expression of STAT3 in cells or tissues, treating an antitheumatic condition associated with STAT3 or a human having a disease or condition associated with STAT3 or a human having a disease or condition dasociated with STAT3 or a human having a disease or condition cancer of the breast, prostate, prain, head are rheumaticid arthritis, cancer of the breast, prostate, parsin, head and/or neck, letkaemia, myeloma, melanoma or lymphoma. (1) can also be used for diagnostic methods in detecting and determining the role of STAT3 in various cell functions, physiological processes and conditions associated with expression of STAT3. (1) can be used alone or with other drugs as an immunostimulator. (1) is used in sandwich and colourimetric assays, involving enzyme conjugation

ô and radiolabeling and is used in diagnostic kits. AAC93150 encodes human STAT3 and AAC99231 encodes mouse STAT3 as given in the exemplification of the present invention. AAC93151 to AAC93232 and AAC93232 to AAC93239 represent STAT3 phosphorothicate antisense oligonucleotides, and AAC93300 represents a mismatch control oligonucleotide which are used in example Gaps .; 0 Length 20; Indels Forward primer #85 used for amplification of HLA-A exon 1.6%; Score 13.2; DB 1; 83.3%; Pred. to the human bc1-6 gene, which inhibit its expression. The antisense oligomucleotides were designed to target different regions of the human coligomucleotides were designed to target different regions of the human bc1-6 mRNA, and were analysed for their effect on bc1-6 mRNA levels by quantitative real-time PCR. Bc1-6 (also known as B-cell GLM, lymphoma 6, zinc finger protein 51 and LAZ3) is a sequence-specific DNA-binding transcriptional repressor. The bc1-6 gene is expressed in germinal centre cornective antibody affinity maturation. Bc1-6 may also play a role in the mediated antibody affinity maturation. Bc1-6 may also play a role in the regulation of apportant of approach of translocation events. Such chromosomal translocations can result in aberrant forms of bc1-6, which are strongly implicated in the pathogenesis of several types of lymphoma, and have also been reported in acute lymphoblastic leukaemia and post-transplant lymphopasis, prevention and treatment of conditions associated with aberrant forms of bc1-6, such as lymphomas, and conditions associated with aberrant forms of bc1-6, such as lymphomas, and allocation leukaemia and post-transplant lymphoblastic leukaemia and post-transplant lymphoblastic leukaemia and post-transplant lymphoblastic leukaemia and post-transplant lymphopatoliferative Antisense compounds which specifically hybridize with and inhibit human bcl-6 expression, useful for treating bcl-6 related disorders, and preventing or delaying inflammation or tumor formation.  The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells,
 Novel antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding human mdm-2 useful for modulating the expression of human mdm-2 and reducing hyperproliferation of human cells.
 The present invention describes an antisense compound (1) up to 30 nucleobases in length, where (1) inhibits expression of daxx (also known as Fas binding protein, GRNP-C binding protein, dap6 for death associated protein 6 and EAP for Etc. 1 associated protein). (1) has cytostatic and antiinflammatory activity, and can be used in antisense therapy and as a modulator of daxx. (1) is useful for inhibiting the expression of daxx in therapeutics for the treatment of diseases associated with the expression of daxx, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation and as research reagent. The present sequence represents an inhibitory human daxx antisense phosphorothioate oligonucleotide which is used in the exemplification of the present invention

 The present sequence is one of a number of antisense compounds of up to 30 nucleobases in length that are capable of inhibiting the expression of phosphoenol pyruvate carboxykinase-cytosolic (PEPCK-cytosolic). The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research creagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence

 This sequence represents a PCR primer for the Pax3 gene, used within the scope of the invention. The invention relates to a method for producing scope of the invention. The invention relates to a method for producing primitive ectoderm-like (EPL) cells and a neural-inducing conditioned primitive ectoderm-like (EPL) cells and a neural-inducing conditioned medium (CM) or extract of it; and (b) contacting the EPL cells with the CM or extract for a time sufficient to generate controlled contaction of interesting the EPL cells with the CM of ferentiation of (I). The cells or partially differentiated progeny are therapy, the screening of pharmaceutical that induce a biological response in neuroectoderm cells or their partially clifferentiation of neural cells. The method is useful for producing centrally differentiated cells. The method is useful for producing neuroectoderm cells. It is also useful for producing centrally differentiated cells from neural ectoderm cells. The method can is also useful for maintaining neuroectoderm cells in vitro in companeous cell populations. It can also be used for producing centerically modified neuroectoderm cells in vitro in contact cells of neuronal diseases, including Parkinson's disease. Huntington's disease, lysosomal storage diseases, multiple sclerosis, memory and behavioural diseases, including Parkinson's disease. Huntington's disease, lysosomal storage diseases, multiple celerosis, cord disorders and Schwarn cells produced by the method are used for the reatment of spinal cord of multiple sclerosis and Schwarn cells produced by the method are used for the reatment of multiple sclerosis.

ö
 The sequences given in AAH43686-93 are primers which were used in the amplification and isolation of the full length cDNA encoding the human AMP-activated protein kinase gamma 3 subunit (PRKAG3). Detecting the presence of the PRKAG3 DNA, or a variant, is useful in determining a risk estimate of a metabolic disease, such as diabetes or obesity, in a subject. The variation may occur in exons 3, 4 or 10. In exon 3 variation may be a substitution of a G for a C at nucleotide 320, resulting in the amino acid substitution P71A, in exon 4 variation may be a substitution of a T for a C at nucleotide 1037, resulting in the amino acid substitution ATA was a concluded 1037, resulting in the mathor acid substitution of these may also be nucleotide variation in intron 6. The numbering of these variations is based on the full length cDNA, with a not active that has no position 1 of the open reading frame. This primer sequence

ð
 the invention relates to antisense oligonucleotides targetted to the human cytohesin-2 gene, which inhibit its expression. A series of coligonucleotides (AAF866776) were designed to target different coligonucleotides (AAF866776) were designed to target different regions of the human cytohesin-2 KRA, and were analysed for their effect on cytohesin-2 mRNA levels by quantitative real-time PCR. Cytohesin-2 is a meanly monomeric described to their effect of cytoscilic adapter proteins which function as guanine nucleotide exchange factors for ADF ribosylation factors traffic pathways. Cytohesin-2 (also known as PSCD2, ARNO for ARF rucleotide binding site opener, mSc7, and ARF exchange factor) is nucleotide binding site opener, mSc7, and ARF exchange factor) is coalised to the plasma membrane and promotes guanine nucleotide exchange on ARF1, ARF3 and ARF6, the latter of which regulates the assembly of the centin cytoskeleton. Through its interaction with ARF6, and in conjunction with protein kinase C, cytohesin-2 functions as a critical link between cell surface receptors and the actin cytoskeleton. The oligonucleotides confittions associated with cytokesin-2 expression, such as expensed to the place of the invention are useful for diagnosis, prevention and treatment of conditions associated with cytohesin-2 expression, such as atheroscierosis, allograft rejection and hyperproliferative disorders,

The invention relates to antisense compounds targeted to a nucleic acid molecule encoding a signal transducer and activator of transcription (STAT) protein, specifically STAT3, where the antisense compounds inhibit the expression of STAT3. The antisense sequences are useful for the expression of STAT3 in cells or tissues, inducing Fascon ediated approprise in cells, and sensitising cells to apoptosis. They are also useful for treating an animal having a disease or condition associated with STAT3. These disorders include inflammatory or autoimmune conseast, protated with an animal having a disease or condition conseast, prostate, brain and head and neck and leukaemias, myelomas, conseast, prostate, brain and head and neck and leukaemias, myelomas, and lumphomas. Also treatable are human diseases or conditions caportotic signals. The sequences of the invention can be used in clinical conseast, for detecting and determining the role of STAT3 in various cell functions and physiological processes and for diagnosing conditions associated with the expression of STAT3 . The sequences represent cDNA encoding human STAT3 and human STAT3 oligonucleotides

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (b) clones of the genomic libraries contained in multiwell plates in a perimer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to plates; (e) the clones in the multiwell plates of the specified clored in the multiwell plates of the specified discrimination Nos. to array the multiwell plates; (e) the clones in the mixed clones of the specified clones are mixed respectively in each wells of longitudinal creation Nos. are mixed respectively in each wells of longitudinal are are specified from the discrimination of the clones in the mitiwell plates are specified from the detected result, and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 21q22.1, which are represent represent present invention invention

Novel antisense compound targeted to nucleic acid molecule encoding Damage-specific DNA-binding protein 1, p127, useful for treating animal having disease associated with the protein such as liver cancer, or hepatitis

Page 89; Claim 3; 121pp; English.

This invention relates to a novel antisense compound 8 to 50 nucleobases in length targeted to nucleic acid molecule encoding Damage-specific DNA-binding protein 1, p127 where the artisense compound specifically hybridises with and inhibite expression of the damage specific DNA binding protein 1 gene. The compounds of the invention may be used in antisense therapy as an inhibitor of expression of Damage-specific DNA binding protein 1, p127. The antisense compounds of the invention are useful for inhibiting the expression of damage specific DNA binding protein 1, p127 in cells or tissues and are also useful for treating an animal having a disease or condition associated with expression of p127, such as a hyperproliferative disorder (e.g., cancer such as breast, skin, liver, or haematopoletic cancer), or hepatitis, by inhibiting the expression of p127. All antisense oligonucleotides of the invention are chimeric oligonucleotides (gapmers) 20 nucleotides in length, composed of

foot-and-mouth disease, Stable, potent effective vaccines against foot-and-mouth disease, comprises recombinantly produced empty virus capsids as antigens.

Example 6; Page 27; 79pp; French.

The present invention relates to a vaccine against foot and mouth disease (FMD) comprising (in addition to a veterinary vehicle or excipient) an antigen consisting of empty FMD virus capsids, obtained by expression in eukaryotic cells of the CDNA of the following regions of the FMD genome: the PI region encoding the capsid and the region encoding the 3C protease. The vaccine is effective, reliable and stable, and is effective at low doses. The vaccine is useful against foot and mouth disease, especially in cows, sheep, pigs or goats. The present sequence is an oligonucleoride which was used in an example from the invention. (Updated on 29-MUG-2003 to standardise OS field)

or preventives for rheumatoid arthritis comprises substances og LARC or its receptor, such as an antibody or antagonist. inhibiting Remedies

Example 10; Page 45; 80pp; Japanese.

The invention relates to remedies or preventives for rheumatoid arthritis containing substances inhibiting LARC or its receptor as the active information. Remedies and preventives can be screened by using model animals with rheumatoid arthritis, comparing and evaluating the LARC inhibitory effect of anti-LARC (receptor) antibody, evaluating the inhibitory ability against cell migration induced by LARC, or evaluating the inhibitory ability against cell migration induced by LARC, or evaluating the inhibitory ability against cell migration induced by the culture supernatant of rheumatoid arthritis patient-originated synovial cells. Remedies or preventives may contain substances produced by partial mutation of LARC polypeptide or substances obtained after modifying the LARC gene by genetic engineering. This sequence represents a PCR primer used to amplify LARC receptor (CCRG) DNA

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion or the constructing a casette having an expressible selectable marker and modifying other allele by promoter. Go that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that contributes to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus of a fort identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the curvity of a gene product, preferably enzymatic activity, carbon compound catabolism biosynthetic, transporter, transcriptional, contributed in signal transduction, DNA replication and cell division cativity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation and cell division cativity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C albicans cells and for treating infection by C albicans. The present sequence data for this patent is not represented in the printed specification of the invention. Note: The sequence of a paracon and cell division contained the patent is not represented in the printed specification of the invention. this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.

Claim 36; SEQ ID NO 5581; 167pp + Sequence Listing; English.

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles of a gene are weful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus of an antifungal agent that inhibits the growth of a manmallan disease. (M1) is useful for identifying a compound which modulates the compound catabolism, biosynthetic, transporter, transcriptional, transduction, DNA replication and cell division activity of a gene product, preferably enzymatic activity, carbon translational, signal transduction, DNA replication and cell division activity the method of is useful for identifying a compound having the ability to inhibit growth or proliferation of c. albicans cells and for treating infection by C. albicans. The present sequence is that of a per primer used in the method of the invention. Note: The sequence data for this patient is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

rheumatoid Treating autoimmune or chronic inflammatory condition e.g. rheumatoic arthritis, multiple sclerosis, by administering agent capable of inhibiting binding of CD30 to CD30L, or interleukin alpha or beta to interleukin-R1.

Example 3; Page 40; 76pp; English.

The present invention relates to a new method for treating autoimmune or chronic inflammatory conditions in a patient. The method of the invention works by administering an agent capable of inhibiting binding of CD30 to CD301 or of IL (interleukin) -lalpha or IL-1beta to IL-RI thereby blocking signal transduction by CD30 or IL-1. The method is useful for treating an autoimmune or chronic inflammatory condition in a patient where the condition is rheumatoid arthritis, multiple sclerosis, systemic or acts motor sensory axonal neuropathy, acute motor sonsory axonal neuropathy acute motor sensory axonal neuropathy acute motor syndrome, systemic lupus erythematosus, scleroderma and pemphigus volgaris. The invention is also useful for screening a candidate therapeutic agent to determine its efficacy in treating an autoimmune or therapeutic agent to determine its efficacy in treating an autoimmune or chronic inflammatory condition that is resistant to treatment with a TWRalpha inhibitor. The pharmaceutical preparation is useful for treating chematic disorders, disorders of the endocrine system, demandologic disorders, hereditary conditions, disorders of the liver, autoimmune or chronic inflammatory disorders of the endocrine system, hereditary conditions, disorders of the endocrine system, skin or mucous membrane disorders, altergies, sarcoidosis, while or muticus membrane disorders, altergies, arteritis, multicentric reticulohisiocytosis, Negener's granulomatosis, arteritis,

 The invention relates to sequence determination oligonucleotides for detecting polymorphic sites in a 5' flanking region of cytochrome P450 206 (CYP206) gene. CYP206 enzymes are involved in the metabolism of many different xenobiotics. Human CYP206 gene is located on chromosome 22. The oligonucleotides may be used as in situ hybridisation probes, in ligase-based determination, as components of diagnostic assays, as probes in sequence determination methods based on mismatches, as hybridisation-based diagnostic assays, and as components of diagnostic microarray. CYP206 is useful to predict variations in an individual's ability to metabolise certain drugs. The present sequence is a PCR primer used for analysing human CYP206 gene containing polymorphic sites
vasculitis and arthritic conditions. The present nucleic acid sequence represents the mouse PCR primer p80-Kas that was used in the methods of the invention for tracking mutations in the mouse p75 gene
 New sequence determination oligonucleotides, useful for detecting polymorphic sites in a 5' flanking region of a CYP2D6 gene, as hybridization probes, as components of diagnostic assays, or in ligase-based sequence determination.

The present sequence is that of reverse PCR primer m14273 for murine 14273 (see ABQB1227), a nucleic acid associated with metabolic disorders. PCR was used to produce a murine 14273 probe (see ABQB1230), which was used to examine the expression profile of 14273. It was found that 14273 molecules are expressed at high levels in adipose tissue, e.g. white adipose tissue, as well as in pancreatic islets. They are upregulated during exposure to cold (i.e. under conditions that affect brown or white adiposyte metabolism) and downregulated in genetic models of bossity. The present invention provides 14273 nucleic acids, polypeptides and antibodies useful for the diagnosis and treatment of metabolic disorders including obesity, anorexia, cachexia and diabetes. Also provided are methods for identifying a subject having a metabolic activity, methods for modulating metabolic activity, methods for modulating metabolic activity, nethods for modulating metabolic activity, methods for modulating metabolic activity or adiposyte activity methods for modulating endogenesis or lipolysis in a subject, and a method for regulating endogenous glucose levels
 ö
 Identifying a nucleic acid associated with a metabolic disorder, useful for disgnosing metabolic disorders, e.g. obesity, comprises contacting the sample with a probe comprising at least 25 contiguous nuclectides of the 14273 gene.

The present invention relates to antisense oligonucleotides, compounds and methods for modulating the expression of E2F transcription factor 2. The antisense oligonucleotides specifically hybridise with and inhibit the expression of E2F transcription factor 2. They are useful for inhibiting the expression of E2F transcription factor 2 and for treating diseases or conditions associated with E2F transcription factor 2, such as hyperproliferative disorders, particularly cancer and developmental disorders. They may also be used as research reagents and diagnostics, to distinguish between functions of various members of a biological pathway and in the treatment of a disease or disorder which can be treated by modulating the expression of E2F transcription factor 2. The oligomeric compounds, particularly the antisense oligonucleotides may be used to modulate the function of nucleic acid molecules encoding E2F transcription factor 2, ultimately modulating the amount of E2F transcription factor 2, ultimately modulating the amount of E2F transcription factor 2, ultimately modulating the amount of E2F transcription factor 2 produced. Sequences of the invention are also used in antisense therapy. The present DNA sequence is human E2F transcription factor 2 produced. Sequence is human E2F transcription factor 2 pages and 2 produced.

The invention relates to a novel antisense compound of 16-30 nucleotides targeted to any of 71 specified regions of the sequence that encodes human cytohesin-1 (CTI), where the compound hybridises and inhibits expression of human CTI. The compound of the invention has antiinflammatory, cytostatic, and anti-infective activity. The antisense compounds may have a use in antisense gene therapy. The antisense compounds are useful for treating or preventing disorders associated with expression of human CTI, e.g. infections, inflammation and tumours, and as research and diagnostic reagents. Sequences ABQ66412-ABQ6511 represent chimaric phosphorothicate oligonucleotides, with 2-MOE wings and a deoxy gap. The claimed sequences inhibit production of cytohesin-1

 The invention relates to a novel antisense compound of 16-30 nucleotides trageted to any of 71 specified regions of the sequence that encodes human cytohesin-1 (CT1), where the compound hybridises and inhibits expression of human CT1. The compound of the invention has antiinflammatory, cytostatic, and anti-infective activity. The antisense compounds may have a use in anti-isense gene therapy. The antisense compounds are useful for treating or preventing disorders associated with as research and diagnostic reagents. Inflammation and tumours, and as research and diagnostic reagents. Sequences ABQ66431-ABQ66511 represent chimmeric phosphorothioate oligonucleotides, with 2'-MOE wings
 sent chimeric phosphorothioate oligonucleotides, with 2'-MOB wings deoxy gap. The claimed sequences inhibit production of cytohesin-1

WPI; 2002-147617/19.

The invention relates to ion channel polypeptides designated as ion-x
(where x is 157-175) and their corresponding nucleic acids. The ion-x
sequences and their modulators are useful for the treatment of human
diseases and conditions such as neurological or psychiatric disorders.

These compounds are useful for treating schizophrenia, attention deficit
hyperactivity disorder, depression, anxiety, stroke, migraine, isohaemia
or neurodegenerative disease (e.g. macular degeneration, Alzheimer's
disease, glaucoma, or Parkinson's disease). The compounds that modulate
ion channels can be used for treating of cardiovascular diseases (e.g.
congestive heart failure, arrhythmia, high blood pressure or restenosis),
metabolic diseases and disorders (e.g. diabetes or obesity), hormonal
proliferation diseases and cancers. The ion channels are also useful as
targets for discovering ligands or drugs to treat many diverse disorders
and defects. The ion-x sequences and their modulators may also be used in
are used in gene therapy. The present sequence is a PCR primer used to
amplify human ion channel gene, ion-159 Sequence 20 BP; 4 A; 6 C; 8 G; 2 T; 0 U; 0 Other; Example 13; Page 95; 126pp; English.

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Claim 15; SEQ ID NO 630; 372pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an attiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antialergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of antiinflammatory steroid in a subject, for reducing levels of adenosine or lung surfactant in a subject, for reducing levels of adenosine receptor, producing broncholation, increasing levels of ubiquinone or lung surfactant in a subject stissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

Katz E, Pabalan J, Aguilar Li Y, Sandrasagra A, Ka Tang L, Shahabuddin S; Nyce JW, I Miller S,

WPI; 2003-229219/22

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 8594; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the control of initiation codon, coding region, 5' or 3' end genomic flanking regions, c' initiation codon, coding region, 5' or 3' end genomic flanking regions, c' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or comparison at larway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a core in a respiratory, lung or malignant disease or condition, also for entainflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing or depleting levels of, or reducing sensitivity to adenosine, reducing or depleting levels of ung inflammation, lung allergies, or a respiratory disease or condition.

C' lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition.

C' lung inflammation, but was obtained in a lectronic format directly from WIPO contents.

Pharmaceutical composition for treating allments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

claim 15; SEQ ID NO 33; 872pp; English

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjudinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of ubjudinone or lung surfactant in a subject stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure, SEQ ID NO 3567; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the instanton codon, coding regalon, 5' or 3' end ganomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjudinone. A composition of the invention has antiinflammatory steroid and ubjudinone. A composition of the invention has antiinflammatory, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or inflammation, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubjudinone or lung surfactant in a subject, stissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Claim 15; SEQ ID NO 1514; 872pp; English.

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an artifinflammatory steroid and ubjquinone. A composition of the invention has antiinflammatory antialergic, antiasthmatic, hypotensive, municosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing pronchodilation, increasing levels of ubjquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO.

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 muclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an artinifammatory teroid and ubiquinone. A composition of the invention has antiinfammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, as 1so for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or enhancing pronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, broaducing levels, or a respiratory disease or condition.

 The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding a hormone-sensitive lipase (HSL) or a splice variant of HSL. The compound specifically hybridises with and inhibits the expression of HSL or a splice variant of HSL, or specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding HSL. (I) have anorectic, therapy. (I) is useful for treating an animal, particularly human, suspected of having an abnormal metabolic condition such is obesity, hyperlipidaemia, type 2 diabetes, a hyperproliferative disorder such as cancer (e.g. pituitary, colorectal, breast, testicular, pulmonary or pithalial cancer). (I) is also useful in modulating blood glucose levels, particularly plasma or serum glucose levels, in a diabetic animal. The present sequence represents a human hormone-sensitive lipase or serum and the sensitive lipase or serum and the serum and serum and the

The invention relates to antisense compounds, compositions and methods for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and HPLA2-10. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with PLA2 group V, e.g. an autoimmune disorder or an inflammatory disorder. It is also useful for modulating PLA2 group V. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PLA2 DNA. This sequence is used to illustrate the method of the invention

 The present invention relates to the development of an elite event, EE-CG (HI, in cotton and to plants or plant material comprising this event. Plant expensively this event.

CHI, in cotton and to plants or plant material comprising this event.

Plants comprising elite event EE-GHI were obtained through transformation with plasmid pGSV71 (see ABZ58559), which comprises the phosphinochrioin-

acetyltransferase coding sequence (bar gane) from Streptomyces

CC hygroscopicus under the control of the cauliflower mosalc virus 35S promoter. Plants harbouring EE-GHI can be obtained from seeds deposited as ATCC PTA-3343. They are characterised by their glufosinate tolerance, which includes plants tolerant of the herbicide Liberty (TM). The cotton plants combine the herbicide tolerant phenotype with optimal agronomic performance. The present sequence is that of PCR primar defined, which is directed to nucleotides 815 to 795 in the 5' flantmer GHI06, which is identifying a transgenic plant, or its cells or tissues, comprising elite event EE-GHI. Amplification of genomic DNA from such a plant using companies of the EE-GHI event EB-GHI elite event the EB-GHI elite event

The present invention describes a compound (I) that is 8-50 nucleobases in length targeted to a nucleic acid molecule encoding a 5'TPR, 3'UTR, coding region, intron region, exon respon, stop codon, intron-exon junction, exon-exon junction, or 5' mRNA variant of src-c, and which specifically hybridises with and inhibits the expression of src-c. (I) have cytostatic, antihinflammatory, osteopathic and antibacterial cartisfies and can be used in antisense therapy and in vaccines. The artisense compounds (I) can be used for modulating the expression of src-crating diseases or conditions associated with expression of src-cr, e.g. aberrant bone remodeling or hyperproliferative disorders, particularly cancer, such as breast cancer, pancreatic cancer, lung cancer, ovarian cancer, casophageal cancer, pancreatic cancer, lung cancer, ovarian cancer, cesophageal cancer, neuroblastoma, retinoblastoma cancer, ovarian cancer, cancer, usuroblastoma, retinoblastoma cor Kaposi's sarcoma. (I) are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. The present sequence represents a mouse src-c antisense chimeric phosphorothioare oligonucleotide, which is used in an example from the present invention

The invention relates to a novel support for ligand immobilization, which is coated with a polyanion which has previously been activated. The support is useful for the production of DNA chips, protain chips, sugar chips and biosensors for investigative and diagnostic uses. Ligands which can be immobilized to the support include agonists, antagonists, toxins, venoms, virus epitopes, hormones, lectins, hormone receptors, peptides, nucleic acids, drugs, sugars, oligonucleotides, proteins, antigens, monoclonal antibodies, cells, viruses, and avidins. In an example of the linvention, the ligand bound to the support is a PCR primer targeted to a number of genes and used to diagnose the presence and potentially the transcribtion of the genes. This sequence represents a 3' primer targeted to the vascular cell adhesion molecule 1 (VCAM-1) gene
 The present sequence oligonucleotide sequence, designated alphal, is based on a human alpha satellite monomer consensus. It was used in alphoid PCR amplifications that demonstrated preferential HIV integration in or near alphoid DNA in latently infected Jurkat cells. The invention provides isolated cells that harbour a latent immunodeficiency virus that

 The invention discloses antisense oligomucleotides that specifically hybridise with a region encoding human serum amyloid A4 (SAA4) and controlled the spersesion. Lipoproteins are globular, micelle-like particles which have been classified into five categories. The protein components of lipoproteins are known as apolipoproteins, and one family of these are controlled these are controlled these are high density lipoprotein (HDL) and act as precursors of the amyloid A proteins found in amyloid fibril deposits formed during the process of proteins found in amyloid fibril deposits formed during the process of myloidesis. The antisense compounds and methods are useful for anyloidasis. The antisense compounds and mathods are also useful for diagnosing, preventing and treating (using antisense therapy) diseases associated with elevated expression of serum amyloid A4, e.g. tumour formation or inflammatory disorders such as rheumatoid arthritis and familial Mediterranean fever. The antisense compounds can also be used as research reagents and diagnostics, or as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within cells or tissues. The sequences presented in ABX4211-ABX3428 are the antisense oligonucleotides which are directed against human SAA4 expression. Each antisense oligonucleotide has a phosphorothioate backbone, all cytidines residues are 5-methylcytidines complement of and bases 1-5 and 16-20 are 2-methoxyethyl (2'-MOE) nucleotides

 New primordial human neural crest stem cell having a pluripotent and self-renewing properties, useful for implantation in vivo for cell therapy treatment of human neurological disorders and diseases.
 The present invention relates to a primordial human neural crest stem cell line suitable for on-demand implantation in vivo into a living host subject comprising a pluripotent and self-renewing neural crest stem cell of human origin. The cell line is useful in the cell therapy treatment of human neurological disorders and diseases. The present sequence is a PCR primer used to isolate human genes from the HNC10 cell line

The present invention relates to a method of inducing differentiation of mammalian embryonic stem cells into functioning cells, which comprises culturing embryonic stem cells in a medium comprising leukaemia inhibitor factor and basic fibroblast growth factor. In particular, the invention crelates to the differentiation of mammalian embryonic stem cells. The method is useful for inducing differentiation of mammalian embryonic stem cells. The method are useful for treating a mammalian compation disorders in pancreatic function, and in nerve function. The cells are pancreatic islet like cell clusters and nerve like cells. Functioning cells induced from embryonic stem cells using the present certain may be used for treating disorders in pancreatic islet function (e.g. diabetes), neuronal degeneration (e.g. Alzheimer's disease and creutzfeldt-Jakob disease) or spinal cord disorders. The functioning cells are useful not only for cell transplant therapy, but for in vitro cells are useful or only for cell transplant therapy, but for in vitro cells are useful or safety evaluation of new drugs. The present sequence is a PCR primer used in the exemplification of the invention

The invention relates to growth hormone 1 (GH-1) gene including single nuclectide polymorphisms (SNP). The GH-1 diagnostic polymuclectide is useful as markers for the analysis of a disease, of susceptibility to drug treatment for GH-1 dysfunction or other diseases, or may be included in any complete or partial genetic map of the human genome. GH-1 mutant polypeptides are useful as anagonists of GH-1 hormone action. Polymuclectides encoding these polypeptides are useful in gene therapy. The present sequence is a PCR primer used for amplifying human GH-1 gene

This invention relates to novel chimeric antisense oligonucleotides that specifically hybridise to and inhibit the expression of the nucleotide binding oligonucleotide domain 1, NOD1 protein. NOD1, also known as CARD4 (caspase associated recruitment domain 4) is a domain that is involved in the elimination of cells via programmed cell death and in the host of defence against pathogens, i.e. it works to requiate apoptosis. Apoptosis is a naturally occurring process, however, if it becomes overstimulated it can lead to cell loss and neurodegenerative conditions including Alzheimer's, Parkinson's, amyotrophic lateral sclerosis (ALS), retinitis process and neurodegenerative conditions including can contribute to the development of cancer, autoimmune disorders and viral infections. The present invention describes antisense collgonucleotides that can modulate NODI expression (and variants thereof), such that these compounds, via gene therapy, can be used to thereof, such that these compounds, via gene therapy, can be used to cligonucleotide sequence is the chimeric antisense oligo used to inhibit expression of human NODI, the aim of the invention. Note that it has two terminal five nucleotide 2'-methoxyethyl (2'-NOE) wings separated by a throughout the thereof the procession is phosphorothioate a composition for treating hyperproliferative disease, e.g., cancer Example 15; Page 76; 138pp; English.

The invention relates to a non-naturally occurring human epidermal growth factor receptor (HER)-3 variant polypeptide comprising amino acids 19-329 or 20-329 of the 1342 amino acid HER3 polypeptide (MEB67617) or a sequence which differs from native HER3 polypeptide and having amino acid substitutions at residues E43, M44, K51, E64, V66 and V110 of S1, is new. The variant HER-3 specifically binds to the hersquilin polypeptide amino acid polypeptide (ADB67619), exhibits an impaired ability to interact with HER2 polypeptide (ADB67619), or has an ability to inhibit the interaction between wild-type HER3 and hersquilin. The polypeptide is useful for identifying a compound which specifically binds to hersquilin binding domain in a HER3 variant polypeptide. The method further involves determining whether the test compound inhibits or enhances the hersquilin induced tyrosine kinase activity associated with a HER3 polypeptide. The interaction between a hersquilin polypeptide is also useful for determining whether a test compound inhibiting the interaction between a hersquilin polypeptide and HER3 polypeptide. The HER3 polypeptide is also useful for inhibiting the interaction between a hersquilin polypeptide and HER3 polypeptide, e.g. for treating cancer. The polypeptide is also useful for simulating or activating HER3 receptor. This sequence represents a PCR primer used to murate the coding sequence for the wild type human HER-3 invention.

This invention relates to novel antisense oligonucleotides that modulate the sypression of human eukaryotic translation initiation factor 2C 1 (EIF2CI). EIF2CI is located on chromosome 1p34-35, and is also known as co-eiF2C, eiF2C, Golgi ER protein 95KDa, GERP95 and 099. It is an intracellular membrane associated protein thought to be involved in affect cell growth, morphology and tumounigenicity. Accordingly, antisense oligonucleotides that inhibit the expression of EIF2CI can antisense oligonucleotides that inhibit the expression of EIF2CI in cells including hyperproliferative disorders, familial hypercholesterolaemia including hyperproliferative disorders, familial hypercholesterolaemia progeriod syndrome. As such, the oligos of the present invention can be described as having cytostatic and antilipaemic activities. The invention comprises antisense oligonucleotides which are targeted to the human madm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating; hyperproliferative oligonucleotides are also useful for treating; hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence Tre presents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a phosphorothioate backbone.
 Novel antisense compound targeted to 5' untranslated region, coding region, or intron:exon junction of nucleic acid molecule encoding mdm2, useful for treating e.g. cancer, psoriasis or restenosis by inhibiting

 The present invention describes a method of determining whether an individual is predisposed to susceptibility to low bone mineral density (BMD) and/or bone damage comprising identifying whether the individual has at least one polymorphism in a polymucleotide encoding a protein, where the polymucleotide is one of 81 200-500 nucleotide sequences (S1, see ADC982135 to ADC98315). An agent identified in an method from the present invention which can be used for the prevention or treatment of a disease resulting in susceptibility to low BMD and/or bone damage is useful in the manufacture of a medicament for use in modulating the susceptibility to low BMD and/or bone damage. The disease associated with low BMD and/or bone damage. The present PCR primer sequence is used in the exemplification of the present invention.
 Determining whether an individual is predisposed to susceptibility to low bone mineral density (BMD) and/or bone damage, involves identifying polymorphisms in associated genes.

This invention relates to novel G protein coupled receptors (GPCRs) and their encoding nucleotide sequences. Many medically significant biological processes are mediated by proteins participating in signal transduction pathways involving G proteins. GPCRs are one of the largest receptor superfamilies known. These receptors are biologically important and malfunction of these receptors results in diseases such as

 PRANCE OF THE PROPERTY OF THE
```

```
The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the target these sites and their activities optimised by either varying the target the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatotisis virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune

The present invention relates to polymorphisms of the human interleukin 4 receptor-alpha gene (IL4R-alpha; see AAF57718 for the reference sequence). Polymucleotides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression vector encoding the isoform may be administered to the patient. It may desirable to decrease or block expression of a particular IL4Ralpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRNA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a probe for human IL4R-alpha

Human endothelin 2 (EDN2) gene polymorphism detecting ASO primer #10.

Human, endothelin 2; EDN2; polymorphic site; PS; therapy; hypertension; dxug screening; cardiovascular disorder; renal insufficiency; ASO; allele specific oligomucleotide; cerebroprotective; polymorphism; hypotensive; cerebrovascular condition; primer; ss.

New human endothelin 2 (EDN2) polymorphic variants and encoding genes, useful in expressing EDN2 protein for screening candidate drugs to treat diseases related to EDN2 activity.

The invention relates to genetic variants of human endothelin 2 (EDN2) gene. EDN2 gene contains 17 polymorphic sites PS1-PS17. The polymorphic variants are useful in studying the expression and function of EDN2, in expressing EDN2 protein for use in screening for candidate drugs to treat diseases related to EDN2 activity, in studying the effect of the candidate drugs targetring EDN2 for the treatment of hypertension, variation on the biological activity of EDN2, and the binding affinity of cardiovascular disorders, renal insufficiency and cerebrovascular conditions. The haplotyping methods are useful in validating EDN2 as a candidate target for treating a specific condition or disease predicted to be associated with EDN2 activity, or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with EDN2 activity, or in the design of clinical trials second with EDN2 activity, or in the design of clinical trials associated with EDN2 activity, Allele specific oligonucleotides (ASO) are

Novel genetic variants of Cytochrome P450, Subfamily IID, Polypeptide isogenes, useful for improving efficiency and reliability in drug development for treating hypertension, arrhythmias and Parkinson's disease

Claim 15; Page 17; 158pp; English.

The invention relates to a method for haplotyping the cytochrome P450, subfamily IID, polypeptide 6 (CYP2D6) gene (ABQ72215, ABQ7264) of an individual, and also describes 29 novel polymorphic sites within the human CYP2D6 gene. The CYP2D6 gene is located on chromosome 22q13.1 and the contains 9 exons which encode a 497 amino acid protein (ABB09563). CYP2D6 is a mono-oxygenase involved in the detoxification of many drugs and environmental chemicals. It plays a role in the metabolism of drugs such as antidarrhythmics, adrenoreceptor antagonists and tricyclic antidepressants, and is also involved in the formation of a metabolite linked to the drug-induced lupus syndrome observed with procainamide. Individual's susceptibility to environmentally-linked diseases, and it has been demonstrated that CYP2D6 activity may be involved in the pathogenesis of Parkinsons's disease, with individuals with a less active form of the enzyme tending to have an earlier onset of this condition. CYP2D6 nucleic acid sequences are useful in studying the expression and function of CYP2D6, and in expressing CYP2D6 protein for use in screening cuts for the treatment of CYP2D6-associated diseases (e.g., hypertension, atrial and ventricular arribythmias, Parkinson's disease, and surgainduced lupus syndrome metabolised by CYP2D6.

The contains and are expressing or parkinson's disease, and surgainduced lupus syndrome metabolised by CYP2D6.

The pathogenesis of parkinson or well and ventricular arribythmias, Parkinson's disease. CYP2D6 nucleic acids and proteins are also useful in studying the effect of polymorphisms on the biological activity of CYP2D6. Polymorphisms in the target region may be determined by the use of allele-specific oligonucleotides (ASOS, ABQ72217-ABQ7303) as probes and primers, and by primer extension using oligonucleotide primers comprising sequences ABQ72304-ABQ72361. The method of the invention is useful for haplotyping the CYP2D6 gene in populations and in individuals, enabling decisions to

```
The invention relates to single nucleotide polymorphisms in the gene encoding the human natriuretic peptide receptor A/quanylate cyclase A (atrionatriuretic peptide receptor A) or NPR1 polypeptide. A method for haplotyping the NPR1 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the NPR1 haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. This method is useful in genotyping, whereby all possible haplotype pairs and a haplotype or haplotype pair of the NPR1 gene can be indentified by comparing the frequency of the haplotype or haplotype pair in a population exhibiting the trait with the frequency of the haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype for haplotype for haplotype in the trait population indicates the trait is associated with
be made as to whether CYP2D6 is a likely therapeutic target for a disease of interest, and to control for genetically-based bias in the design of drugs that target or are metabolised by CYP2D6. In addition, transgenic animals comprising a human CYP2D6 gene are useful for studying the expression of CYP2D6 isogenes in vivo, for in vivo screening and testing of drugs targeted to or metabolised by CYP2D6, and for testing the efficacy of therapeutic agents and compounds for treating CYP2D6 associated conditions in a biological system. Sequences ABQ72217-ABQ72245 represent specifically claimed allele-specific oligonucleotide (ASO) probes used for detecting polymorphisms in the CYP2D6 gene
 Genotyping human natriuretic peptide receptor A/guanylate cyclase gene of

 The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid our ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of hepatocallular carcinoma. The HCV tibozymes are also useful for treat cirrhosis, liver failure and/or hepatocallular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially
 viral
the haplotype or haplotype pair. NPR1 and its corresponding DNA are used for studying the expression and function of NPR1, for use in screening for candidate drugs to treat diseases related to NPR1 activity, such as hypertension. The sequences are also useful for studying the effect of variation on the biological activity of NPR1 as well as on the binding affinity of candidate drugs targeting NPR1. Sequences AAS99959-AAS9990 and ABX09390-ABK09462 represent probes, sequencing primers and PCR primers used to detect NPR1 gene polymorphisms

therapies, Regulated expression of cyclin D1 can be used in cancer therapies, such as breast, colon or pancreatic cancers and familial adenates polyposis. Regulation of the activity of CD40L gene promoter may be used in the treatment of immunological disorders, such as autoimmune diseases e.g. multiple sclerosis (MS), systematic lupus carthritis. Regulated expression of genes under the control of the HBV (hepatitis B)-specific core, pre-S and X promoters can be used in the therapy of HBV disease, chronic hepatic insufficiency, cirrhosis, hepaticis and collular carcinoma, and in the regulated expression of liver cell-specific genes. Regulated expression of the vanh gene promoter can be used in treatment of Enterococcus infection, while regulated expression of the vanh gene promoter can be used in the treatment of prostate cancer. This sequence represents a mutated promoter region used in the invention to determine the regulatory regions involved in gene invention, described in the method of the invention

New calmodulin-1 (CALM-1) isogene polymorphic variants, useful in expressing CALM1 protein for use in screening for candidate drugs to treat diseases related to CALM1 activity such as Alzheimer's disease.

Claim 15; Page 13; 82pp; English

The invention relates to an isolated polynucleotide comprising a sequence selected from a polymorphic variant of calmodulin 1 (CALM1). The polymorphic variant comprises an CALM1 isospene defined by a haplotype selected from haplotypes 1-21 given in the specification. The polymorphisms are useful for studying the biological function of CALM1 as well as in identifying drugs targeting this protein for the treatment of a disorder related to its abnormal expression or function. The polymorphic variants may also be used in screening for compounds targeting CALM1 to treat a specific condition or disease predicted to be

```
associated with CALMI activity. Establishing CALMI haplotype or haplotype pair of an individual is useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with SCYA3 activity, e.g. Alzheimer's disease and diseases involving defects in calcium-dependent signal transduction. Haplotyping the CALMI gene in an individual is also useful in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with CALMI activity, Assosso2-Aassocols represent human CALMI allele- specific oligonucleotides and PCR primers of the invention

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 mucleic acids in samples, as amplification substrates, to provide intial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration of the sequence senceding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1; in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the printed hGDMLP-1 sequence data for this patent did not form part of the printed processing a concentration of the printed processing and concentration of the printed processing and concentration of the printed printed printed processing and concentration of the printed printed printed processing and concentration of the printed processing and concentration of the printed

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements and for case as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specific biomolecule and/or amount specifically of hGDMLP-proteins, as specific biomolecule and/or amount specifically of hGDMLP-proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a polymucleotide sequence encoding hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence date for this patient did not form part of the printed specification, but was obtained in electronic format directly from WIPO
 New polypeptide, for raising antibodies that recognize hCDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
